1. Introduction

This is basically just a list of things that we want to put in the stacks project. As we add material to the project continuously this is always somewhat behind the current state of the project. In fact, it may have been a mistake to try and list things we should add, because it seems impossible to keep it up to date.

Last updated: Thursday, May 9, 2013.

2. Conventions

We should have a chapter with a short list of conventions used in the document. This chapter already exists, see Conventions, Section [1] but a lot more could be added there. Especially useful would be to find “hidden” conventions and tacit assumptions and put those there.

---

This is a chapter of the Stacks Project, version 7e38297, compiled on Feb 17, 2015.
3. Sites and Topoi

We have a chapter on sites and sheaves, see Sites, Section 1. We have a chapter on
inged sites (and topoi) and modules on them, see Modules on Sites, Section 1. We
have a chapter on cohomology in this setting, see Cohomology on Sites, Section 1.
But a lot more could be added, especially in the chapter on cohomology.

4. Stacks

We have a chapter on (abstract) stacks, see Stacks, Section 1. It would be nice if
(1) improve the discussion on “stackyfication”,
(2) give examples of stackyfication,
(3) more examples in general,
(4) improve the discussion of gerbes.

Example result which has not been added yet: Given a sheaf of abelian groups
$F$ over $C$ the set of equivalence classes of gerbes with “group” $F$ is bijective to
$H^2(C,F)$.

5. Simplicial methods

We have a chapter on simplicial methods, see Simplicial, Section 1. This has to
be reviewed and improved. The discussion of the relationship between simplicial
homotopy (also known as combinatorial homotopy) and Kan complexes should
be improved upon. Moreover, there should be a chapter on “simplicial algebraic
geometry”, where we discuss simplicial schemes, and how to think of their geometry,
cohomology, etc. Then this should be tied into the chapter on hypercoverings to
“explain” the results of this chapter in the new language.

6. Cohomology of schemes

There is already a chapter on cohomology of quasi-coherent sheaves, see Cohomol-
yogy of Schemes, Section 1. We also have chapters on étale cohomology of schemes,
crystalline cohomology of schemes, derived categories of schemes. But most of the
material is very basic and a lot more could be added here.

7. Deformation theory à la Schlessinger

We have a chapter on this material, see Formal Deformation Theory, Section 1.
What is needed is worked out examples of the general theory, for example the case
of representations of a fixed abstract group.

8. Definition of algebraic stacks

An algebraic stack is a stack in groupoids over the category of schemes with the fppf
topology that has a diagonal representable by algebraic spaces and is the target of a
surjective smooth morphism from a scheme. The notion “Deligne-Mumford stack”
will be reserved for a stack as in [DM69]. We will reserve the term “Artin stack”
for a stack such as in the papers by Artin [Art69], and [Art74]. (See also [CdJ02].)
In other words, and Artin stack will be an algebraic stack with some reasonable
finiteness and separatedness conditions.
9. Examples of schemes, algebraic spaces, algebraic stacks

It really is not that hard to show that $\mathcal{M}_g$ is an algebraic stack for $g \geq 2$. We should really have a long list of moduli problems here and prove they are all algebraic stacks. Some of them we can prove are algebraic using Artin approximation. For example the Kontsevich moduli space in characteristic $p > 0$.

Here are some items for the list of moduli problems mentioned above.

1. $\mathcal{M}_g$, i.e., moduli of smooth projective curves of genus $g$,
2. $\overline{\mathcal{M}}_g$, i.e., moduli of stable genus $g$ curves,
3. $\mathcal{A}_g$, i.e., principally polarized abelian schemes of genus $g$,
4. $\mathcal{M}_{1,1}$, i.e., 1-pointed smooth projective genus 1 curves,
5. $\mathcal{M}_{g,n}$, i.e., smooth projective genus $g$-curves with $n$ pairwise distinct labeled points,
6. $\overline{\mathcal{M}}_{g,n}$, i.e., stable $n$-pointed nodal projective genus $g$-curves,
7. $\mathcal{H}om_S(\mathcal{X}, \mathcal{Y})$, moduli of morphisms (with suitable conditions on the stacks $\mathcal{X}$, $\mathcal{Y}$ and the base scheme $S$),
8. $\text{Bun}_G(X) = \mathcal{H}om_S(X, BG)$, the stack of $G$-bundles of the geometric Langlands programme (with suitable conditions on the scheme $X$, the group scheme $G$, and the base scheme $S$),
9. $\text{Pic}_X/S$, i.e., the Picard stack associated to an algebraic stack over a base scheme (or space).

How about the algebraic space you get from the deformation theory of a general surface in $\mathbb{P}^3$ with a node? (I mean where you deform it to a general smooth surface in $\mathbb{P}^3$.) Perhaps we can talk about some small dimensional examples here too. For example the stack where you have $\mathbb{A}^1$ with a $B(\mathbb{Z}/2)$ sitting at 0. Bugeyed covers. And so on.

10. Properties of algebraic stacks

This is perhaps one of the easier projects to work on, as most of the basic theory is there now. An interesting project is discussing the various ways of defining what a proper algebraic stack is. Of course these things are really properties of morphisms of stacks. We can define singularities (up to smooth factors) etc. Prove that a connected normal stack is irreducible, etc.

11. Lisse étale site of an algebraic stack

This has been introduced in Cohomology of Stacks, Section [11]. An example to show that it is not functorial with respect to 1-morphisms of algebraic stacks is discussed in Examples, Section [50]. Of course a lot more could be said about this, but it turns out to be very useful to prove things using the “big” étale site as much as possible.

12. Things you always wanted to know but were afraid to ask

There are going to be lots of lemmas that you use over and over again that are useful but aren’t really mentioned specifically in the literature, or it isn’t easy to find references for. Bag of tricks.

Example: Given two groupoids in schemes $R \Rightarrow U$ and $R' \Rightarrow U'$ what does it mean to have a 1-morphism $[U/R] \to [U'/R']$ purely in terms of groupoids in schemes.
13. Quasi-coherent sheaves on stacks

These are defined and discussed in the chapter Cohomology of Stacks, Section 1. Derived categories of modules are discussed in the chapter Derived Categories of Stacks, Section 1. A lot more could be added to these chapters.

14. Flat and smooth

Artin’s theorem that having a flat surjection from a scheme is a replacement for the smooth surjective condition. This is now available as Criteria for Representability, Theorem 16.1.

15. Artin’s representability theorem

This is discussed in the chapter Artin’s Axioms, Section 1. We also have an application, see Quot, Theorem 5.12. There should be a lot more applications and the chapter itself has to be cleaned up as well.

16. DM stacks are finitely covered by schemes

This all begins with Gabber’s lemma I think. Somewhere in Asterisque about Faltings proof of Mordell?

17. Martin Olsson’s paper on properness

This proves two notions of proper are the same. We can also discuss Faltings result that it suffices to use DVR’s in certain cases.

18. Proper pushforward of coherent sheaves

No comments yet.

19. Keel and Mori

See [KM97]. This material has been incorporated throughout the Stacks project. See for example More on Groupoids, Section 12 and More on Groupoids in Spaces, Section 12.

20. Add more here

Please.
