1. Introduction

In this chapter we study divisors on algebraic spaces and related topics. A basic reference for algebraic spaces is [Knu71].

2. Associated and weakly associated points

In the case of schemes we have introduced two competing notions of associated points. Namely, the usual associated points (Divisors, Section 2) and the weakly associated points (Divisors, Section 5). For a general algebraic space the notion of an associated point is basically useless and we don’t even bother to introduce it. If the algebraic space is locally Noetherian, then we allow ourselves to use the phrase “associated point” instead of “weakly associated point” as the notions are the same for Noetherian schemes (Divisors, Lemma 5.8). Before we make our definition, we need a lemma.
\textbf{Lemma 2.1.} Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $x \in |X|$. The following are equivalent

1. for some étale morphism $f : U \to X$ with $U$ a scheme and $u \in U$ mapping to $x$, the point $u$ is weakly associated to $f^* \mathcal{F}$,
2. for every étale morphism $f : U \to X$ with $U$ a scheme and $u \in U$ mapping to $x$, the point $u$ is weakly associated to $f^* \mathcal{F}$,
3. the maximal ideal of $\mathcal{O}_{X, \pi}$ is a weakly associated prime of the stalk $\mathcal{F}_\pi$.

If $X$ is locally Noetherian, then these are also equivalent to

4. for some étale morphism $f : U \to X$ with $U$ a scheme and $u \in U$ mapping to $x$, the point $u$ is associated to $f^* \mathcal{F}$,
5. for every étale morphism $f : U \to X$ with $U$ a scheme and $u \in U$ mapping to $x$, the point $u$ is associated to $f^* \mathcal{F}$,
6. the maximal ideal of $\mathcal{O}_{X, \pi}$ is an associated prime of the stalk $\mathcal{F}_\pi$.

\textbf{Proof.} Choose a scheme $U$ with a point $u$ and an étale morphism $f : U \to X$ mapping $u$ to $x$. Lift $\pi$ to a geometric point of $U$ over $u$. Recall that $\mathcal{O}_{X, \pi} = \mathcal{O}_{U, u}^h$ where the strict henselization is with respect to our chosen lift of $\pi$, see Properties of Spaces, Lemma 22.1. Finally, we have

$$\mathcal{F}_\pi = (f^* \mathcal{F})_u \otimes_{\mathcal{O}_{U, u}} \mathcal{O}_{X, \pi} = (f^* \mathcal{F})_u \otimes_{\mathcal{O}_{U, u}} \mathcal{O}_{U, u}^h$$

by Properties of Spaces, Lemma 29.4. Hence the equivalence of (1), (2), and (3) follows from More on Flatness, Lemma 2.9. If $X$ is locally Noetherian, then any $U$ as above is locally Noetherian, hence we see that (1), resp. (2) are equivalent to (4), resp. (5) by Divisors, Lemma 5.8. On the other hand, in the locally Noetherian case the local ring $\mathcal{O}_{X, \pi}$ is Noetherian too (Properties of Spaces, Lemma 24.4). Hence the equivalence of (3) and (6) by the same lemma (or by Algebra, Lemma 65.9). \[\square\]

\textbf{Definition 2.2.} Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Let $x \in |X|$.

1. We say $x$ is weakly associated to $\mathcal{F}$ if the equivalent conditions (1), (2), and (3) of Lemma 2.1 are satisfied.
2. We denote $\text{WeakAss}(\mathcal{F})$ the set of weakly associated points of $\mathcal{F}$.
3. The weakly associated points of $X$ are the weakly associated points of $\mathcal{O}_X$.

If $X$ is locally Noetherian we will say $x$ is associated to $\mathcal{F}$ if and only if $x$ is weakly associated to $\mathcal{F}$ and we set $\text{Ass}(\mathcal{F}) = \text{WeakAss}(\mathcal{F})$. Finally (still assuming $X$ is locally Noetherian), we will say $x$ is an associated point of $X$ if and only if $x$ is a weakly associated point of $X$.

At this point we can prove the obligatory lemmas.

\textbf{Lemma 2.3.} Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Then $\text{WeakAss}(\mathcal{F}) \subseteq \text{Supp}(\mathcal{F})$.

\textbf{Proof.} This is immediate from the definitions. The support of an abelian sheaf on $X$ is defined in Properties of Spaces, Definition 20.3. \[\square\]

\textbf{Lemma 2.4.} Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $0 \to \mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3 \to 0$ be a short exact sequence of quasi-coherent sheaves on $X$. Then $\text{WeakAss}(\mathcal{F}_2) \subseteq \text{WeakAss}(\mathcal{F}_1) \cup \text{WeakAss}(\mathcal{F}_3)$ and $\text{WeakAss}(\mathcal{F}_1) \subseteq \text{WeakAss}(\mathcal{F}_2)$. \[\square\]
Let $\pi \in X$ the sequence of stalks $0 \to \mathcal{F}_1,_{\pi} \to \mathcal{F}_2,_{\pi} \to \mathcal{F}_3,_{\pi} \to 0$ is a short exact sequence of $\mathcal{O}_{X, \pi}$-modules. Hence the lemma follows from Algebra, Lemma 05.4.

**Lemma 2.5.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Then

$$\mathcal{F} = (0) \iff \text{WeakAss}(\mathcal{F}) = \emptyset$$

**Proof.** Choose a scheme $U$ and a surjective étale morphism $f : U \to X$. Then $\mathcal{F}$ is zero if and only if $f^*\mathcal{F}$ is zero. Hence the lemma follows from the definition and the lemma in the case of schemes, see Divisors, Lemma 05.5.

**Lemma 2.6.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $x \in |X|$. If

1. $x \in \text{Supp}(\mathcal{F})$
2. $x$ is a codimension $0$ point of $X$ (Properties of Spaces, Definition 01.3).

Then $x \in \text{WeakAss}(\mathcal{F})$. If $\mathcal{F}$ is a finite type $\mathcal{O}_X$-module with scheme theoretic support $Z$ (Morphisms of Spaces, Definition 01.4) and $x$ is a codimension $0$ point of $Z$, then $x \in \text{WeakAss}(\mathcal{F})$.

**Proof.** Since $x \in \text{Supp}(\mathcal{F})$ the stalk $\mathcal{F}_{\pi}$ is not zero. Hence $\text{WeakAss}(\mathcal{F}_{\pi})$ is nonempty by Algebra, Lemma 05.5. On the other hand, the spectrum of $\mathcal{O}_{X, \pi}$ is a singleton. Hence $x$ is a weakly associated point of $\mathcal{F}$ by definition. The final statement follows as $\mathcal{O}_{X, \pi} \to \mathcal{O}_{Z, \pi}$ is a surjection, the spectrum of $\mathcal{O}_{Z, \pi}$ is a singleton, and $\mathcal{F}_{\pi}$ is a nonzero module over $\mathcal{O}_{Z, \pi}$.

**Lemma 2.7.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $x \in |X|$. If

1. $X$ is decent (for example quasi-separated or locally separated),
2. $x \in \text{Supp}(\mathcal{F})$
3. $x$ is not a specialization of another point in $\text{Supp}(\mathcal{F})$.

Then $x \in \text{WeakAss}(\mathcal{F})$.

**Proof.** (A quasi-separated algebraic space is decent, see Decent Spaces, Section 01.6. A locally separated algebraic space is decent, see Decent Spaces, Lemma 01.2.) Choose a scheme $U$, a point $u \in U$, and an étale morphism $f : U \to X$ mapping $u$ to $x$. By Decent Spaces, Lemma 01.4 if $u' \to u$ is a nontrivial specialization, then $f(u') \neq x$. Hence we see that $u \in \text{Supp}(f^*\mathcal{F})$ is not a specialization of another point of $\text{Supp}(f^*\mathcal{F})$. Hence $u \in \text{WeakAss}(f^*\mathcal{F})$ by Divisors, Lemma 05.5.

**Lemma 2.8.** Let $S$ be a scheme. Let $X$ be a locally Noetherian algebraic space over $S$. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module. Then $\text{Ass}(\mathcal{F}) \cap W$ is finite for every quasi-compact open $W \subset |X|$.

**Proof.** Choose a quasi-compact scheme $U$ and an étale morphism $U \to X$ such that $W$ is the image of $|U| \to |X|$. Then $U$ is a Noetherian scheme and we may apply Divisors, Lemma 05.5 to conclude.

**Lemma 2.9.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. If $U \to X$ is an étale morphism such that $\text{WeakAss}(\mathcal{F}) \subset \text{Im}([U] \to |X|)$, then $\Gamma(X, \mathcal{F}) \to \Gamma(U, \mathcal{F})$ is injective.
Proof. Let \( s \in \Gamma(X, \mathcal{F}) \) be a section which restricts to zero on \( U \). Let \( \mathcal{F}' \subset \mathcal{F} \) be the image of the map \( \mathcal{O}_X \to \mathcal{F} \) defined by \( s \). Then \( \mathcal{F}'|_U = 0 \). This implies that \( \text{WeakAss}(\mathcal{F}') \cap \text{Im}(|U| \to |X|) = \emptyset \) (by the definition of weakly associated points). On the other hand, \( \text{WeakAss}(\mathcal{F}') \subset \text{WeakAss}(\mathcal{F}) \) by Lemma 2.4. We conclude \( \text{WeakAss}(\mathcal{F}') = \emptyset \). Hence \( \mathcal{F}' = 0 \) by Lemma 2.5. 

**Lemma 2.10.** Let \( S \) be a scheme. Let \( f : X \to Y \) be a quasi-compact and quasi-separated morphism of algebraic spaces over \( S \). Let \( \mathcal{F} \) be a quasi-coherent \( \mathcal{O}_X \)-module. Let \( y \in |Y| \) be a point which is not in the image of \( |f| \). Then \( y \) is not weakly associated to \( f_* \mathcal{F} \).

**Proof.** By Morphisms of Spaces, Lemma 11.2 the \( \mathcal{O}_Y \)-module \( f_* \mathcal{F} \) is quasi-coherent hence the lemma makes sense. Choose an affine scheme \( V \), a point \( v \in V \), and an étale morphism \( V \to Y \) mapping \( v \) to \( y \). We may assume \( Y \) is an affine scheme. In this case \( X \) is quasi-compact, hence we can choose an affine scheme \( U \) and a surjective étale morphism \( U \to X \). Denote \( g : U \to Y \) the composition. Then \( f_* \mathcal{F} \subset g_*(\mathcal{F}|_U) \). By Lemma 2.4 we reduce to the case of schemes which is Divisors, Lemma 5.9. 

**Lemma 2.11.** Let \( S \) be a scheme. Let \( X \) be an algebraic space over \( S \). Let \( \phi : \mathcal{F} \to \mathcal{G} \) be a map of quasi-coherent \( \mathcal{O}_X \)-modules. Assume that for every \( x \in |X| \) at least one of the following happens

1. \( \mathcal{F}_x \to \mathcal{G}_x \) is injective, or
2. \( x \notin \text{WeakAss}(\mathcal{F}) \).

Then \( \phi \) is injective.

**Proof.** The assumptions imply that \( \text{WeakAss}(\text{Ker}(\phi)) = \emptyset \) and hence \( \text{Ker}(\phi) = \emptyset \) by Lemma 2.5.

**Lemma 2.12.** Let \( S \) be a scheme. Let \( X \) be a reduced algebraic space over \( S \). Then the weakly associated point of \( X \) are exactly the codimension 0 points of \( X \).

**Proof.** Working étale locally this follows from Divisors, Lemma 5.12 and Properties of Spaces, Lemma 11.1.

3. Morphisms and weakly associated points

**Lemma 3.1.** Let \( S \) be a scheme. Let \( f : X \to Y \) be an affine morphism of algebraic spaces over \( S \). Let \( \mathcal{F} \) be a quasi-coherent \( \mathcal{O}_X \)-module. Then we have

\[ \text{WeakAss}_S(f_* \mathcal{F}) \subset f(\text{WeakAss}_X(\mathcal{F})) \]

**Proof.** Choose a scheme \( V \) and a surjective étale morphism \( V \to Y \). Set \( U = X \times_Y V \). Then \( U \to V \) is an affine morphism of schemes. By our definition of weakly associated points the problem is reduced to the morphism of schemes \( U \to V \). This case is treated in Divisors, Lemma 6.1.

**Lemma 3.2.** Let \( S \) be a scheme. Let \( f : X \to Y \) be an affine morphism of algebraic spaces over \( S \). Let \( \mathcal{F} \) be a quasi-coherent \( \mathcal{O}_X \)-module. If \( X \) is locally Noetherian, then we have

\[ \text{WeakAss}_Y(f_* \mathcal{F}) = f(\text{WeakAss}_X(\mathcal{F})) \]
Proof. Choose a scheme $V$ and a surjective étale morphism $V \to Y$. Set $U = X \times_Y V$. Then $U \to V$ is an affine morphism of schemes and $U$ is locally Noetherian. By our definition of weakly associated points the problem is reduced to the morphism of schemes $U \to V$. This case is treated in Divisors, Lemma 6.2.

\[ \square \]

Lemma 3.3. Let $S$ be a scheme. Let $f : X \to Y$ be a finite morphism of algebraic spaces over $S$. Let $F$ be a quasi-coherent $\mathcal{O}_X$-module. Then $\text{WeakAss}(f_*F) = \text{WeakAss}(f) \cdot \text{WeakAss}(F)$.

Proof. Choose a scheme $V$ and a surjective étale morphism $V \to Y$. Set $U = X \times_Y V$. Then $U \to V$ is a finite morphism of schemes. By our definition of weakly associated points the problem is reduced to the morphism of schemes $U \to V$. This case is treated in Divisors, Lemma 6.3.

\[ \square \]

Lemma 3.4. Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. Let $G$ be a quasi-coherent $\mathcal{O}_Y$-module. Let $x \in |X|$ and $y = f(x) \in |Y|$. If

1. $y \in \text{WeakAss}_S(G)$,
2. $f$ is flat at $x$, and
3. the dimension of the local ring of the fibre of $f$ at $x$ is zero (Morphisms of Spaces, Definition 33.1),

then $x \in \text{WeakAss}(f^*G)$.

Proof. Choose a scheme $V$, a point $v \in V$, and an étale morphism $V \to Y$ mapping $v$ to $y$. Choose a scheme $U$, a point $u \in U$, and an étale morphism $U \to V \times_Y X$ mapping $v$ to a point lying over $v$ and $x$. This is possible because there is a $t \in |V \times_Y X|$ mapping to $(v, y)$ by Properties of Spaces, Lemma 4.3. By definition we see that the dimension of $O_{U_{x,u}}$ is zero. Hence $u$ is a generic point of the fiber $U_v$. By our definition of weakly associated points the problem is reduced to the morphism of schemes $U \to V$. This case is treated in Divisors, Lemma 6.4.

\[ \square \]

Lemma 3.5. Let $K/k$ be a field extension. Let $X$ be an algebraic space over $k$. Let $F$ be a quasi-coherent $\mathcal{O}_X$-module. Let $y \in X_K$ with image $x \in X$. If $y$ is a weakly associated point of the pullback $\mathcal{F}_K$, then $x$ is a weakly associated point of $F$.

Proof. This is the translation of Divisors, Lemma 6.5 into the language of algebraic spaces. We omit the details of the translation.

\[ \square \]

Lemma 3.6. Let $S$ be a scheme. Let $f : X \to Y$ be a finite flat morphism of algebraic spaces. Let $G$ be a quasi-coherent $\mathcal{O}_Y$-module. Let $x \in |X|$ be a point with image $y \in |Y|$. Then

$$x \in \text{WeakAss}(f^*G) \iff y \in \text{WeakAss}(G)$$

Proof. Follows immediately from the case of schemes (More on Flatness, Lemma 2.7) by étale localization.

\[ \square \]

Lemma 3.7. Let $S$ be a scheme. Let $f : X \to Y$ be an étale morphism of algebraic spaces. Let $G$ be a quasi-coherent $\mathcal{O}_Y$-module. Let $x \in |X|$ be a point with image $y \in |Y|$. Then

$$x \in \text{WeakAss}(f^*G) \iff y \in \text{WeakAss}(G)$$

Proof. This is immediate from the definition of weakly associated points and in fact the corresponding lemma for the case of schemes (More on Flatness, Lemma 2.8) is the basis for our definition.

\[ \square \]
4. Relative weak assassin

**Lemma 4.1.** Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. Let $y \in |Y|$. The following are equivalent

1. for some scheme $V$, point $v \in V$, and étale morphism $V \to Y$ mapping $v$ to $y$, the algebraic space $X_v$ is locally Noetherian,
2. for every scheme $V$, point $v \in V$, and étale morphism $V \to Y$ mapping $v$ to $y$, the algebraic space $X_v$ is locally Noetherian, and
3. there exists a field $k$ and a morphism $\text{Spec}(k) \to Y$ representing $y$ such that $X_k$ is locally Noetherian.

If there exists a field $k_0$ and a monomorphism $\text{Spec}(k_0) \to Y$ representing $y$, then these are also equivalent to

4. the algebraic space $X_{k_0}$ is locally Noetherian.

**Proof.** Observe that $X_v = v \times_Y X = \text{Spec}(\kappa(v)) \times_Y X$. Hence the implications $(2) \Rightarrow (1) \Rightarrow (3)$ are clear. Assume that $\text{Spec}(k) \to Y$ is a morphism from the spectrum of a field such that $X_k$ is locally Noetherian. Let $V \to Y$ be an étale morphism from a scheme $V$ and let $v \in V$ a point mapping to $y$. Then the scheme $v \times_Y \text{Spec}(k)$ is nonempty. Choose a point $w \in v \times_Y \text{Spec}(k)$. Consider the morphisms

$$X_w \leftarrow X_w \to X_k$$

Since $V \to Y$ is étale and since $w$ may be viewed as a point of $V \times_Y \text{Spec}(k)$, we see that $\kappa(w) \supset k$ is a finite separable extension of fields (Morphisms, Lemma 34.7). Thus $X_w \to X_k$ is a finite étale morphism as a base change of $w \to \text{Spec}(k)$. Hence $X_w$ is locally Noetherian (Morphisms of Spaces, Lemma 23.5). The morphism $X_w \to X_v$ is a surjective, affine, flat morphism as a base change of the surjective, affine, flat morphism $w \to v$. Then the fact that $X_w$ is locally Noetherian implies that $X_v$ is locally Noetherian. This can be seen by picking a surjective étale morphism $U \to X$ and then using that $U_w \to U_v$ is surjective, affine, and flat. Working affine locally on the scheme $U_v$ we conclude that $U_w$ is locally Noetherian by Algebra, Lemma 158.1.

Finally, it suffices to prove that (3) implies (4) in case we have a monomorphism $\text{Spec}(k_0) \to Y$ in the class of $y$. Then $\text{Spec}(k) \to Y$ factors as $\text{Spec}(k) \to \text{Spec}(k_0) \to Y$. The argument given above then shows that $X_k$ being locally Noetherian implies that $X_{k_0}$ is locally Noetherian. 

**Definition 4.2.** Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. Let $y \in |Y|$. We say the fibre of $f$ over $y$ is locally Noetherian if the equivalent conditions (1), (2), and (3) of Lemma 4.1 are satisfied. We say the fibres of $f$ are locally Noetherian if this holds for every $y \in |Y|$.

Of course, the usual way to guarantee locally Noetherian fibres is to assume the morphism is locally of finite type.

**Lemma 4.3.** Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. If $f$ is locally of finite type, then the fibres of $f$ are locally Noetherian.

**Proof.** This follows from Morphisms of Spaces, Lemma 23.5 and the fact that the spectrum of a field is Noetherian. 

□
Lemma 4.4. Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. Let $x \in |X|$ and $y = f(x) \in |Y|$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Consider commutative diagrams

$$
\begin{array}{c}
X & \xrightarrow{X} & X \times_Y V & \xleftarrow{X} & X_v & \xleftarrow{X} & U & \xleftarrow{x} & x' & \xleftarrow{u} & U_v \\
\downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
Y & \xrightarrow{V} & V & \xleftarrow{v} & V & \xleftarrow{v} & V & \xleftarrow{y} & v & \xleftarrow{v} & v
\end{array}
$$

where $V$ and $U$ are schemes, $V \to Y$ and $U \to X \times_Y V$ are étale, $v \in V$, $x' \in |X_v|$, $u \in U$ are points related as in the last diagram. Denote $\mathcal{F}|_{X_v}$ and $\mathcal{F}|_{U_v}$ the pullbacks of $\mathcal{F}$. The following are equivalent

1. for some $V, v, x'$ as above $x'$ is a weakly associated point of $\mathcal{F}|_{X_v}$,
2. for every $V \to Y, v, x'$ as above $x'$ is a weakly associated point of $\mathcal{F}|_{X_v}$,
3. for some $U, V, u, v$ as above $u$ is a weakly associated point of $\mathcal{F}|_{U_v}$,
4. for every $U, V, u, v$ as above $u$ is a weakly associated point of $\mathcal{F}|_{U_v}$,
5. for some field $k$ and morphism $\text{Spec}(k) \to Y$ representing $y$ and some $t \in |X_k|$ mapping to $x$, the point $t$ is a weakly associated point of $\mathcal{F}|_{X_k}$.

If there exists a field $k_0$ and a monomorphism $\text{Spec}(k_0) \to Y$ representing $y$, then these are also equivalent to

6. $x_0$ is a weakly associated point of $\mathcal{F}|_{X_{k_0}}$ where $x_0 \in |X_{k_0}|$ is the unique point mapping to $x$.

If the fibre of $f$ over $y$ is locally Noetherian, then in conditions (1), (2), (3), (4), and (6) we may replace “weakly associated” with “associated”.

Proof. Observe that given $V, v, x'$ as in the lemma we can find $U \to X \times_Y V$ and $u \in U$ mapping to $x'$ and then the morphism $U_v \to X_v$ is étale. Thus it is clear that (1) and (3) are equivalent as well as (2) and (4). Each of these implies (5). We will show that (5) implies (2). Suppose given $V, v, x'$ as well as $\text{Spec}(k) \to X$ and $t \in |X_k|$ such that the point $t$ is a weakly associated point of $\mathcal{F}|_{X_k}$. We can choose a point $w \in v \times_Y \text{Spec}(k)$. Then we obtain the morphisms

$$
X_v \leftarrow X_w \to X_k
$$

Since $V \to Y$ is étale and since $w$ may be viewed as a point of $V \times_Y \text{Spec}(k)$, we see that $\kappa(w) \supset k$ is a finite separable extension of fields (Morphisms, Lemma 34.7). Thus $X_w \to X_k$ is a finite étale morphism as a base change of $w \to \text{Spec}(k)$. Thus any point $x''$ of $X_w$ lying over $t$ is a weakly associated point of $\mathcal{F}|_{X_w}$ by Lemma 3.7. We may pick $x''$ mapping to $x'$ (Properties of Spaces, Lemma 4.3). Then Lemma 3.5 implies that $x'$ is a weakly associated point of $\mathcal{F}|_{X_v}$.

To finish the proof it suffices to show that the equivalent conditions (1) – (5) imply (6) if we are given $\text{Spec}(k_0) \to Y$ as in (6). In this case the morphism $\text{Spec}(k) \to \text{Spec}(k_0) \to Y$. Then $x_0$ is the image of $t$ under the morphism $X_k \to X_{k_0}$. Hence the same lemma as above shows that (6) is true.

Definition 4.5. Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. The relative weak assassin of $\mathcal{F}$ in $X$ over $Y$ is the set $\text{WeakAss}_{X/Y}(\mathcal{F}) \subset |X|$ consisting of those $x \in |X|$ such that the equivalent conditions of Lemma 4.4 are satisfied. If the fibres of $f$ are locally Noetherian (Definition 4.2) then we use the notation $\text{Ass}_{X/Y}(\mathcal{F})$. 

\[ \square \]
With this notation we can formulate some of the results already proven for schemes.

**Lemma 4.6.** Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_Y$-module. Assume

1. $\mathcal{F}$ is flat over $Y$,
2. $X$ and $Y$ are locally Noetherian, and
3. the fibres of $f$ are locally Noetherian.

Then

$$\text{Ass}_X(\mathcal{F} \otimes_{\mathcal{O}_X} f^* \mathcal{G}) = \{ x \in \text{Ass}_{X/Y}(\mathcal{F}) \text{ such that } f(x) \in \text{Ass}_{Y}(\mathcal{G}) \}$$

**Proof.** Via étale localization, this is an immediate consequence of the result for schemes, see Divisors, Lemma 3.1. The result for schemes is more general only because we haven’t defined associated points for non-Noetherian algebraic spaces (hence we need to assume $X$ and the fibres of $X \to Y$ are locally Noetherian to even be able to formulate this result).

**Lemma 4.7.** Let $S$ be a scheme. Let

$$
\begin{array}{ccc}
X' & \xrightarrow{g'} & X \\
\downarrow{f'} & & \downarrow{f} \\
Y' & \xrightarrow{g} & Y
\end{array}
$$

be a cartesian diagram of algebraic spaces over $S$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module and set $\mathcal{F}' = (g')^* \mathcal{F}$. If $f$ is locally of finite type, then

1. $x' \in \text{Ass}_{X'/Y'}(\mathcal{F}') \Rightarrow g'(x') \in \text{Ass}_{X/Y}(\mathcal{F})$
2. if $x \in \text{Ass}_{X/Y}(\mathcal{F})$, then given $y' \in |Y'|$ with $f(x) = g(y')$, there exists an $x' \in \text{Ass}_{X'/Y'}(\mathcal{F}')$ with $g'(x') = x$ and $f'(x') = y'$.

**Proof.** This follows from the case of schemes by étale localization. We write out the details completely. Choose a scheme $V$ and a surjective étale morphism $V \to Y$. Choose a scheme $U$ and a surjective étale morphism $U \to V \times_Y X$. Choose a scheme $V'$ and a surjective étale morphism $V' \to V \times_Y Y'$. Then $U' = V' \times_Y U$ is a scheme and the morphism $U' \to X'$ is surjective and étale.

Proof of (1). Choose $u' \in U'$ mapping to $x'$. Denote $v' \in V'$ the image of $u'$. Then $x' \in \text{Ass}_{X'/Y'}(\mathcal{F}')$ is equivalent to $u' \in \text{Ass}(\mathcal{F}|_{U'_v})$ by definition (writing Ass instead of WeakAss makes sense as $U'_v$ is locally Noetherian). Applying Divisors, Lemma 7.3, we see that the image $u \in U$ of $u'$ is in $\text{Ass}(\mathcal{F}|_{U_v})$ where $v \in V$ is the image of $u$. This in turn means $g'(x') \in \text{Ass}_{X/Y}(\mathcal{F})$.

Proof of (2). Choose $u \in U$ mapping to $x$. Denote $v \in V$ the image of $u$. Then $x \in \text{Ass}_{X/Y}(\mathcal{F})$ is equivalent to $u \in \text{Ass}(\mathcal{F}|_{U_v})$ by definition. Choose a point $v' \in V'$ mapping to $y' \in |Y'|$ and to $v \in V$ (possibly by Properties of Spaces, Lemma 4.3). Let $t \in \text{Spec}(\kappa(v') \otimes_{\kappa(v)} \kappa(u))$ be a generic point of an irreducible component. Let $u' \in U'$ be the image of $t$. Applying Divisors, Lemma 7.3, we see that $u' \in \text{Ass}(\mathcal{F}|_{U'_{v'}})$. This in turn means $x' \in \text{Ass}_{X'/Y'}(\mathcal{F}')$ where $x' \in |X'|$ is the image of $u'$.

**Lemma 4.8.** With notation and assumptions as in Lemma 4.7. Assume $g$ is locally quasi-finite, or more generally that for every $y' \in |Y'|$ the transcendence degree of $y'/g(y')$ is 0. Then $\text{Ass}_{X'/Y'}(\mathcal{F}')$ is the inverse image of $\text{Ass}_{X/Y}(\mathcal{F})$. 
**Proof.** The transcendence degree of a point over its image is defined in Morphisms of Spaces, Definition 33.1. Let \( x' \in |X'| \) with image \( x \in |X| \). Choose a scheme \( V \) and a surjective étale morphism \( V \to Y \). Choose a scheme \( U \) and a surjective étale morphism \( U \to V \times_Y X \). Choose a scheme \( V' \) and a surjective étale morphism \( V' \to V \times_Y Y' \). Then \( U' = V' \times_V U \) is a scheme and the morphism \( U' \to X' \) is surjective and étale. Choose \( u \in U \) mapping to \( x \). Denote \( v \in V \) the image of \( u \). Then \( x \in \text{Ass}_{X/Y}(\mathcal{F}) \) is equivalent to \( u \in \text{Ass}(\mathcal{F}|_{U_\nu}) \) by definition. Choose a point \( u' \in U' \) mapping to \( x' \in |X'| \) and to \( u \in U \) (possible by Properties of Spaces, Lemma \[4.3\]). Let \( v' \in V' \) be the image of \( u' \). Then \( x' \in \text{Ass}_{X'/Y'}(\mathcal{F}') \) is equivalent to \( u' \in \text{Ass}(\mathcal{F}'|_{U'_{\nu'}}) \) by definition. Now the lemma follows from the discussion in Divisors, Remark \[3.4\] applied to \( u' \in \text{Spec}(\kappa(v') \otimes_{\kappa(v)} \kappa(u)) \). □

**Lemma 4.9.** Let \( S \) be a scheme. Let \( f : X \to Y \) be a morphism of algebraic spaces over \( S \). Let \( i : Z \to X \) be a finite morphism. Let \( \mathcal{G} \) be a quasi-coherent \( \mathcal{O}_Z \)-module. Then \( \text{WeakAss}_{X/Y}(i_*\mathcal{G}) = i(\text{WeakAss}_{Z/Y}(\mathcal{G})) \).

**Proof.** Follows from the case of schemes (Divisors, Lemma \[8.3\]) by étale localization. Details omitted. □

**Lemma 4.10.** Let \( Y \) be a scheme. Let \( X \) be an algebraic space of finite presentation over \( Y \). Let \( \mathcal{F} \) be a quasi-coherent \( \mathcal{O}_X \) -module of finite presentation. Let \( U \subset X \) be an open subspace such that \( U \to Y \) is quasi-compact. Then the set \( E = \{ y \in Y \mid \text{Ass}_Y(\mathcal{F}_y) \subset |U_y| \} \) is locally constructible in \( Y \).

**Proof.** Note that since \( Y \) is a scheme, it makes sense to take the fibres \( X_y = \text{Spec}(\kappa(y)) \times_Y X \). (Also, by our definitions, the set \( \text{Ass}_Y(\mathcal{F}_y) \) is exactly the fibre of \( \text{Ass}_{X/Y}(\mathcal{F}) \to Y \) over \( y \), but we won’t need this.) The question is local on \( Y \), indeed, we have to show that \( E \) is constructible if \( Y \) is affine. In this case \( X \) is quasi-compact. Choose an affine scheme \( W \) and a surjective étale morphism \( \varphi : W \to X \). Then \( \text{Ass}_X(\varphi^*\mathcal{F}_y) \) is the image of \( \text{Ass}_{W_y}(\varphi^*\mathcal{F}_y) \) for all \( y \in Y \). Hence the lemma follows from the case of schemes for the open \( \varphi^{-1}(U) \subset W \) and the morphism \( W \to Y \). The case of schemes is More on Morphisms, Lemma \[23.5\]. □

5. Fitting ideals

This section is the continuation of the discussion in Divisors, Section \[9\]. Let \( S \) be a scheme. Let \( X \) be an algebraic space over \( S \). Let \( \mathcal{F} \) be a finite type, quasi-coherent \( \mathcal{O}_X \) -module. In this situation we can construct the Fitting ideals

\[0 = \text{Fit}_{-1}(\mathcal{F}) \subset \text{Fit}_0(\mathcal{F}) \subset \text{Fit}_1(\mathcal{F}) \subset \ldots \subset \mathcal{O}_X\]

as the sequence of quasi-coherent sheaves ideals idealized by the following property: for every affine \( U = \text{Spec}(A) \) étale over \( X \) if \( \mathcal{F}|_U \) corresponds to the \( A \)-module \( M \), then \( \text{Fit}_i(\mathcal{F})|_U \) corresponds to the ideal \( \text{Fit}_i(M) \subset A \). This is well defined and a quasi-coherent sheaf of ideals because if \( A \to B \) is an étale ring map, then the \( i \)th Fitting ideal of \( M \otimes_A B \) over \( B \) is equal to \( \text{Fit}_i(M) \otimes_A B \) by More on Algebra, Lemma \[8.4\] part (3). More precisely (perhaps), the existence of the quasi-coherent sheaves of ideals \( \text{Fit}_0(\mathcal{O}_X) \) follows (for example) from the description of quasi-coherent sheaves in Properties of Spaces, Lemma \[29.3\] and the pullback property given in Divisors, Lemma \[9.1\].
The advantage of constructing the Fitting ideals in this way is that we see immediately that formation of Fitting ideals commutes with étale localization hence many properties of the Fitting ideals immediately reduce to the corresponding properties in the case of schemes. Often we will use the discussion in Properties of Spaces, Section 30 to do the translation between properties of quasi-coherent sheaves on schemes and on algebraic spaces.

**Lemma 5.1.** Let $S$ be a scheme. Let $f : X \rightarrow Y$ be a morphism of algebraic spaces over $S$. Let $\mathcal{F}$ be a finite type, quasi-coherent $\mathcal{O}_Y$-module. Then $f^{-1} \text{Fit}_i(\mathcal{F}) \cdot \mathcal{O}_X = \text{Fit}_i(f^* \mathcal{F})$.

**Proof.** Reduces to Divisors, Lemma 9.1 by étale localization. □

**Lemma 5.2.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a finitely presented $\mathcal{O}_X$-module. Then $\text{Fit}_r(\mathcal{F})$ is a quasi-coherent ideal of finite type.

**Proof.** Reduces to Divisors, Lemma 9.2 by étale localization. □

**Lemma 5.3.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a finite type, quasi-coherent $\mathcal{O}_X$-module. Let $Z_0 \subset X$ be the closed subspace cut out by $\text{Fit}_0(\mathcal{F})$. Let $Z \subset X$ be the scheme theoretic support of $\mathcal{F}$. Then

1. $Z \subset Z_0 \subset X$ as closed subspaces,
2. $|Z| = |Z_0| = \text{Supp}(\mathcal{F})$ as closed subsets of $|X|$,
3. there exists a finite type, quasi-coherent $\mathcal{O}_{Z_0}$-module $\mathcal{G}_0$ with

$$(Z_0 \rightarrow X)_* \mathcal{G}_0 = \mathcal{F}.$$  

**Proof.** Recall that formation of $Z$ commutes with étale localization, see Morphisms of Spaces, Definition 15.4 (which uses Morphisms of Spaces, Lemma 15.3 to define $Z$). Hence (1) and (2) follow from the case of schemes, as mentioned in Divisors, Lemma 9.3. To get $\mathcal{G}_0$ as in part (3) we can use that we have $\mathcal{G}$ on $Z$ as in Morphisms of Spaces, Lemma 15.3 and set $\mathcal{G}_0 = (Z \rightarrow Z_0)_* \mathcal{G}$. □

**Lemma 5.4.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a finite type, quasi-coherent $\mathcal{O}_X$-module. Let $x \in |X|$. Then $\mathcal{F}$ can be generated by $r$ elements in an étale neighbourhood of $x$ if and only if $\text{Fit}_r(\mathcal{F}) = 0$ and $\text{Fit}_r(\mathcal{F}) = \mathcal{O}_X$, and

1. $\text{Fit}_k(\mathcal{F}) = 0$ for $k < r$ and $\text{Fit}_k(\mathcal{F}) = \mathcal{O}_X$ for $k \geq r$.

**Proof.** Reduces to Divisors, Lemma 9.4 by étale localization (as well as the description of the local ring in Properties of Spaces, Section 22 and the fact that the strict henselization of a local ring is faithfully flat to see that the equality over the strict henselization is equivalent to the equality over the local ring). □

**Lemma 5.5.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a finite type, quasi-coherent $\mathcal{O}_X$-module. The closed subspaces

$$X = Z_{-1} \supset Z_0 \supset Z_1 \supset Z_2 \ldots$$

defined by the Fitting ideals of $\mathcal{F}$ have the following properties...
(1) The intersection $\bigcap Z_r$ is empty.

(2) The functor $(\text{Sch}/X)^{\text{opp}} \to \text{Sets}$ defined by the rule

\[ T \mapsto \begin{cases} \{\ast\} & \text{if } F_T \text{ is locally generated by } \leq r \text{ sections} \\ \emptyset & \text{otherwise} \end{cases} \]

is representable by the open subspace $X \setminus Z_r$.

(3) The functor $F_r : (\text{Sch}/X)^{\text{opp}} \to \text{Sets}$ defined by the rule

\[ T \mapsto \begin{cases} \{\ast\} & \text{if } F_T \text{ locally free rank } r \\ \emptyset & \text{otherwise} \end{cases} \]

is representable by the locally closed subspace $Z_{r-1} \setminus Z_r$ of $X$.

If $F$ is of finite presentation, then $Z_r \to X$, $X \setminus Z_r \to X$, and $Z_{r-1} \setminus Z_r \to X$ are of finite presentation.

**Proof.** Reduces to Divisors, Lemma 9.6 by étale localization. □

**Lemma 5.7.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $F$ be an $\mathcal{O}_X$-module of finite presentation. Let $X = Z_{-1} \subset Z_0 \subset Z_1 \subset \ldots$ be as in Lemma 5.6. Set $X_r = Z_{r-1} \setminus Z_r$. Then $X' = \coprod_{r \geq 0} X_r$ represents the functor

\[ F_{\text{flat}} : \text{Sch}/X \to \text{Sets}, \quad T \mapsto \begin{cases} \{\ast\} & \text{if } F_T \text{ flat over } T \\ \emptyset & \text{otherwise} \end{cases} \]

Moreover, $F|_{X_r}$ is locally free of rank $r$ and the morphisms $X_r \to X$ and $X' \to X$ are of finite presentation.

**Proof.** Reduces to Divisors, Lemma 9.7 by étale localization. □

### 6. Effective Cartier divisors

For some reason it seem convenient to define the notion of an effective Cartier divisor before anything else. Note that in Morphisms of Spaces, Section 13 we discussed the correspondence between closed subspaces and quasi-coherent sheaves of ideals. Moreover, in Properties of Spaces, Section 30, we discussed properties of quasi-coherent modules, in particular “locally generated by 1 element”. These references show that the following definition is compatible with the definition for schemes.

**Definition 6.1.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$.

(1) A locally principal closed subspace of $X$ is a closed subspace whose sheaf of ideals is locally generated by 1 element.

(2) An effective Cartier divisor on $X$ is a closed subspace $D \subset X$ such that the ideal sheaf $\mathcal{I}_D \subset \mathcal{O}_X$ is an invertible $\mathcal{O}_X$-module.

Thus an effective Cartier divisor is a locally principal closed subspace, but the converse is not always true. Effective Cartier divisors are closed subspaces of pure codimension 1 in the strongest possible sense. Namely they are locally cut out by a single element which is not a zerodivisor. In particular they are nowhere dense.

**Lemma 6.2.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $D \subset X$ be a closed subspace. The following are equivalent:

(1) The subspace $D$ is an effective Cartier divisor on $X$.

(2) For some scheme $U$ and surjective étale morphism $U \to X$ the inverse image $D \times_X U$ is an effective Cartier divisor on $U$. 
(3) For every scheme $U$ and every étale morphism $U \to X$ the inverse image $D \times_X U$ is an effective Cartier divisor on $U$.

(4) For every $x \in |D|$ there exists an étale morphism $(U, u) \to (X, x)$ of pointed algebraic spaces such that $U = \text{Spec}(A)$ and $D \times_X U = \text{Spec}(A/(f))$ with $f \in A$ not a zerodivisor.

**Proof.** The equivalence of (1) – (3) follows from Definition 6.1 and the references preceding it. Assume (1) and let $x \in |D|$. Choose a scheme $W$ and a surjective étale morphism $W \to X$. Choose $w \in D \times_X W$ mapping to $x$. By (3) $D \times_X W$ is an effective Cartier divisor on $W$. Hence we can find affine étale neighbourhood $U$ by choosing an affine open neighbourhood of $w$ in $W$ as in Divisors, Lemma 13.2. Assume (4). Then we see that $\mathcal{I}_D|_U$ is invertible by Divisors, Lemma 13.2. Since we can find an étale covering of $X$ by the collection of all such $U$ and $X \setminus D$, we conclude that $\mathcal{I}_D$ is an invertible $\mathcal{O}_X$-module. □

**Lemma 6.3.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $Z \subset X$ be a locally principal closed subspace. Let $U = X \setminus Z$. Then $U \to X$ is an affine morphism.

**Proof.** The question is étale local on $X$, see Morphisms of Spaces, Lemmas 20.3 and Lemma 6.2. Thus this follows from the case of schemes which is Divisors, Lemma 13.3. □

**Lemma 6.4.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $D \subset X$ be an effective Cartier divisor. Let $U = X \setminus D$. Then $U \to X$ is an affine morphism and $U$ is scheme theoretically dense in $X$.

**Proof.** Affineness is Lemma 6.3. The density question is étale local on $X$ by Morphisms of Spaces, Definition 17.3. Thus this follows from the case of schemes which is Divisors, Lemma 13.4. □

**Lemma 6.5.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $D \subset X$ be an effective Cartier divisor. Let $x \in |D|$. If $\dim_x(X) < \infty$, then $\dim_x(D) < \dim_x(X)$.

**Proof.** Both the definition of an effective Cartier divisor and of the dimension of an algebraic space at a point (Properties of Spaces, Definition 9.1) are étale local. Hence this lemma follows from the case of schemes which is Divisors, Lemma 13.3. □

**Definition 6.6.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Given effective Cartier divisors $D_1$, $D_2$ on $X$ we set $D = D_1 + D_2$ equal to the closed subspace of $X$ corresponding to the quasi-coherent sheaf of ideals $\mathcal{I}_{D_1} \mathcal{I}_{D_2} \subset \mathcal{O}_S$. We call this the sum of the effective Cartier divisors $D_1$ and $D_2$.

It is clear that we may define the sum $\sum n_i D_i$ given finitely many effective Cartier divisors $D_i$ on $X$ and nonnegative integers $n_i$.

**Lemma 6.7.** The sum of two effective Cartier divisors is an effective Cartier divisor.

**Proof.** Omitted. Étale locally this reduces to the following simple algebra fact: if $f_1, f_2 \in A$ are nonzerodivisors of a ring $A$, then $f_1 f_2 \in A$ is a nonzerodivisor. □
Lemma 6.8. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $Z, Y$ be two closed subspaces of $X$ with ideal sheaves $I$ and $J$. If $IJ$ defines an effective Cartier divisor $D \subset X$, then $Z$ and $Y$ are effective Cartier divisors and $D = Z + Y$.

Proof. By Lemma 6.2 this reduces to the case of schemes which is Divisors, Lemma 13.9. □

Recall that we have defined the inverse image of a closed subspace under any morphism of algebraic spaces in Morphisms of Spaces, Definition 13.2.

Lemma 6.9. Let $S$ be a scheme. Let $f : X' \to X$ be a morphism of algebraic spaces over $S$. Let $Z \subset X$ be a locally principal closed subspace. Then the inverse image $f^{-1}(Z)$ is a locally principal closed subspace of $X'$.

Proof. Omitted. □

Definition 6.10. Let $S$ be a scheme. Let $f : X' \to X$ be a morphism of algebraic spaces over $S$. Let $D \subset X$ be an effective Cartier divisor. We say the pullback of $D$ by $f$ is defined if the closed subspace $f^{-1}(D) \subset X'$ is an effective Cartier divisor. In this case we denote it either $f^*D$ or $f^{-1}(D)$ and we call it the pullback of the effective Cartier divisor.

The condition that $f^{-1}(D)$ is an effective Cartier divisor is often satisfied in practice.

Lemma 6.11. Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. Let $D \subset Y$ be an effective Cartier divisor. The pullback of $D$ by $f$ is defined in each of the following cases:

1. $f(x) \notin |D|$ for any weakly associated point $x$ of $X$,
2. $f$ is flat, and
3. add more here as needed.

Proof. Working étale locally this lemma reduces to the case of schemes, see Divisors, Lemma 13.13. □

Lemma 6.12. Let $S$ be a scheme. Let $f : X' \to X$ be a morphism of algebraic spaces over $S$. Let $D_1, D_2$ be effective Cartier divisors on $X$. If the pullbacks of $D_1$ and $D_2$ are defined then the pullback of $D = D_1 + D_2$ is defined and $f^*D = f^*D_1 + f^*D_2$.

Proof. Omitted. □

7. Effective Cartier divisors and invertible sheaves

Since an effective Cartier divisor has an invertible ideal sheaf (Definition 6.1) the following definition makes sense.

Definition 7.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$ and let $D \subset X$ be an effective Cartier divisor with ideal sheaf $I_D$.

1. The invertible sheaf $\mathcal{O}_X(D)$ associated to $D$ is defined by
   $\mathcal{O}_X(D) = \mathcal{H}om_{\mathcal{O}_X}(I_D, \mathcal{O}_X) = I_D^{-1}$.
2. The canonical section, usually denoted $1$ or $1_D$, is the global section of $\mathcal{O}_X(D)$ corresponding to the inclusion mapping $I_D \to \mathcal{O}_X$.
3. We write $\mathcal{O}_X(-D) = \mathcal{O}_X(D)^{-1} = I_D$. 

(4) Given a second effective Cartier divisor $D' \subset X$ we define $\mathcal{O}_X(D - D') = \mathcal{O}_X(D) \otimes_{\mathcal{O}_X} \mathcal{O}_X(-D')$.

Some comments. We will see below that the assignment $D \mapsto \mathcal{O}_X(D)$ turns addition of effective Cartier divisors (Definition 6.6) into addition in the Picard group of $X$ (Lemma 7.3). However, the expression $D - D'$ in the definition above does not have any geometric meaning. More precisely, we can think of the set of effective Cartier divisors on $X$ as a commutative monoid $\text{EffCart}(X)$ whose zero element is the empty effective Cartier divisor. Then the assignment $(D, D') \mapsto \mathcal{O}_X(D - D')$ defines a group homomorphism

$$\text{EffCart}(X)^{gp} \rightarrow \text{Pic}(X)$$

where the left hand side is the group completion of $\text{EffCart}(X)$. In other words, when we write $\mathcal{O}_X(D - D')$ we may think of $D - D'$ as an element of $\text{EffCart}(X)^{gp}$.

**Lemma 7.2.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $D \subset X$ be an effective Cartier divisor. Then for the conormal sheaf we have $\mathcal{C}_{D/X} = \mathcal{I}_D|D = \mathcal{O}_X(D)^{\otimes -1}|_D$.

**Proof.** Omitted. □

**Lemma 7.3.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $D_1$, $D_2$ be effective Cartier divisors on $X$. Let $D = D_1 + D_2$. Then there is a unique isomorphism

$$\mathcal{O}_X(D_1) \otimes_{\mathcal{O}_X} \mathcal{O}_X(D_2) \rightarrow \mathcal{O}_X(D)$$

which maps $1_{D_1} \otimes 1_{D_2}$ to $1_D$.

**Proof.** Omitted. □

**Definition 7.4.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{L}$ be an invertible sheaf on $X$. A global section $s \in \Gamma(X, \mathcal{L})$ is called a regular section if the map $\mathcal{O}_X \rightarrow \mathcal{L}$, $f \mapsto fs$ is injective.

**Lemma 7.5.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $f \in \Gamma(X, \mathcal{O}_X)$. The following are equivalent:

1. $f$ is a regular section, and
2. for any $x \in X$ the image $f \in \mathcal{O}_{X,x}$ is not a zerodivisor.
3. for any affine $U = \text{Spec}(A)$ étale over $X$ the restriction $f|_U$ is a nonzero-divisor of $A$, and
4. there exists a scheme $U$ and a surjective étale morphism $U \rightarrow X$ such that $f|_U$ is a regular section of $\mathcal{O}_U$.

**Proof.** Omitted. □

Note that a global section $s$ of an invertible $\mathcal{O}_X$-module $\mathcal{L}$ may be seen as an $\mathcal{O}_X$-module map $s : \mathcal{O}_X \rightarrow \mathcal{L}$. Its dual is therefore a map $s : \mathcal{L}^{\otimes -1} \rightarrow \mathcal{O}_X$. (See Modules on Sites, Lemma 31.4 for the dual invertible sheaf.)

**Definition 7.6.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{L}$ be an invertible sheaf. Let $s \in \Gamma(X, \mathcal{L})$. The zero scheme of $s$ is the closed subspace $Z(s) \subset X$ defined by the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ which is the image of the map $s : \mathcal{L}^{\otimes -1} \rightarrow \mathcal{O}_X$. 

Lemma 7.7. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $L$ be an invertible $O_X$-module. Let $s \in \Gamma(X, L)$.

1. Consider closed immersions $i : Z \to X$ such that $i^*s \in \Gamma(Z, i^*L)$ is zero ordered by inclusion. The zero scheme $Z(s)$ is the maximal element of this ordered set.

2. For any morphism of algebraic spaces $f : Y \to X$ over $S$ we have $f^*s = 0$ in $\Gamma(Y, f^*L)$ if and only if $f$ factors through $Z(s)$.

3. The zero scheme $Z(s)$ is a locally principal closed subspace of $X$.

4. The zero scheme $Z(s)$ is an effective Cartier divisor on $X$ if and only if $s$ is a regular section of $L$.

Proof. Omitted.

Lemma 7.8. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$.

1. If $D \subset X$ is an effective Cartier divisor, then the canonical section $1_D$ of $O_X(D)$ is regular.

2. Conversely, if $s$ is a regular section of the invertible sheaf $L$, then there exists a unique effective Cartier divisor $D = Z(s) \subset X$ and a unique isomorphism $O_X(D) \to L$ which maps $1_D$ to $s$.

The constructions $D \mapsto (O_X(D), 1_D)$ and $(L, s) \mapsto Z(s)$ give mutually inverse maps

$$\{\text{effective Cartier divisors on } X\} \leftrightarrow \left\{\text{pairs } (L, s) \text{ consisting of an invertible } O_X\text{-module and a regular global section}\right\}$$

Proof. Omitted.

8. Effective Cartier divisors on Noetherian spaces

In the locally Noetherian setting most of the discussion of effective Cartier divisors and regular sections simplifies somewhat.

Lemma 8.1. Let $S$ be a scheme and let $X$ be a locally Noetherian algebraic space over $S$. Let $D \subset X$ be an effective Cartier divisor. If $X$ is $(S_k)$, then $D$ is $(S_{k-1})$.

Proof. By our definition of the property $(S_k)$ for algebraic spaces (Properties of Spaces, Section 7) and Lemma 6.2 this follows from the case of schemes (Divisors, Lemma 15.5).

Lemma 8.2. Let $S$ be a scheme and let $X$ be a locally Noetherian normal algebraic space over $S$. Let $D \subset X$ be an effective Cartier divisor. Then $D$ is $(S_1)$.

Proof. By our definition of normality for algebraic spaces (Properties of Spaces, Section 7) and Lemma 6.2 this follows from the case of schemes (Divisors, Lemma 15.6).

The following lemma can sometimes be used to produce effective Cartier divisors.

Lemma 8.3. Let $S$ be a scheme. Let $X$ be a regular Noetherian separated algebraic space over $S$. Let $U \subset X$ be a dense affine open. Then there exists an effective Cartier divisor $D \subset X$ with $U = X \setminus D$.

Proof. We claim that the reduced induced algebraic space structure $D$ on $X \setminus U$ (Properties of Spaces, Definition 12.6) is the desired effective Cartier divisor. The construction of $D$ commutes with étale localization, see proof of Properties of Spaces, Lemma 12.4. Let $X' \to X$ be a surjective étale morphism with $X'$ affine.
Since $X$ is separated, we see that $U' = X' \times_X U$ is affine. Since $|X'| \to |X|$ is open, we see that $U'$ is dense in $X'$. Since $D' = X' \times_X D$ is the reduced induced scheme structure on $X' \setminus U'$, we conclude that $D'$ is an effective Cartier divisor by Divisors, Lemma 10.4 and its proof. This is what we had to show. □

**Lemma 8.4.** Let $S$ be a scheme. Let $X$ be a regular Noetherian separated algebraic space over $S$. Then every invertible $\mathcal{O}_X$-module is isomorphic to

$$
\mathcal{O}_X(D - D') = \mathcal{O}_X(D) \otimes_{\mathcal{O}_X} \mathcal{O}_X(D')^{\otimes -1}
$$

for some effective Cartier divisors $D, D'$ in $X$.

**Proof.** Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Choose a dense affine open $U \subset X$ such that $\mathcal{L}|_U$ is trivial. This is possible because $X$ has a dense open subspace which is a scheme, see Properties of Spaces, Proposition 13.3. Denote $s : \mathcal{O}_U \to \mathcal{L}|_U$ the trivialization. The complement of $U$ is an effective Cartier divisor $D$. We claim that for some $n > 0$ the map $s$ extends uniquely to a map

$$
s : \mathcal{O}_X(-nD) \to \mathcal{L}
$$

The claim implies the lemma because it shows that $\mathcal{L} \otimes_{\mathcal{O}_X} \mathcal{O}_X(nD)$ has a regular global section hence is isomorphic to $\mathcal{O}_X(D')$ for some effective Cartier divisor $D'$ by Lemma 7.3. To prove the claim we may work étale locally. Thus we may assume $X$ is an affine Noetherian scheme. Since $\mathcal{O}_X(-nD) = \mathcal{I}^n$ where $\mathcal{I} = \mathcal{O}_X(-D)$ is the ideal sheaf of $D$ in $X$, this case follows from Cohomology of Schemes, Lemma 10.4. □

The following lemma really belongs to a different section.

**Lemma 8.5.** Let $R$ be a valuation ring with fraction field $K$. Let $X$ be an algebraic space over $R$ such that $X \to \text{Spec}(R)$ is smooth. For every effective Cartier divisor $D \subset X_K$ there exists an effective Cartier divisor $D' \subset X$ with $D'_K = D$.

**Proof.** Let $D' \subset X$ be the scheme theoretic image of $D \to X_K \to X$. Since this morphism is quasi-compact, formation of $D'$ commutes with flat base change, see Morphisms of Spaces, Lemma 30.12. In particular we find that $D'_K = D$. Hence, we may assume $X$ is affine. Say $X = \text{Spec}(A)$. Then $X_K = \text{Spec}(A \otimes_R K)$ and $D$ corresponds to an ideal $I \subset A \otimes_R K$. We have to show that $J = I \cap A$ cuts out an effective Cartier divisor in $X$. First, observe that $A/J$ is flat over $R$ (as a torsion free $R$-module, see More on Algebra, Lemma 22.10), hence $J$ is finitely generated by More on Algebra, Lemma 25.6 and Algebra, Lemma 5.3. Thus it suffices to show that $J_q \subset A_q$ is generated by a single element for each prime $q \subset A$. Let $p = R \cap q$. Then $R_p$ is a valuation ring (Algebra, Lemma 49.8). Observe further that $A_q/pA_q$ is a regular ring by Algebra, Lemma 138.3. Thus we may apply More on Algebra, Lemma 104.9 to see that $I(A_q \otimes_R K)$ is generated by a single element $f \in A_q \otimes_R K$. After clearing denominators we may assume $f \in A_q$. Let $\mathfrak{c} \subset R_p$ be the content ideal of $f$ (see More on Algebra, Definition 24.1 and More on Flatness, Lemma 19.6). Since $R_p$ is a valuation ring and since $\mathfrak{c}$ is finitely generated (More on Algebra, Lemma 24.2) we see $\mathfrak{c} = (\pi)$ for some $\pi \in R_p$ (Algebra, Lemma 49.15). After relacing $f$ by $\pi^{-1}f$ we see that $f \in A_q$ and $f \not\in pA_q$. Claim: $I_q = (f)$ which finishes the proof. To see the claim, observe that $f \in I_q$. Hence we have a surjection $A_q/(f) \to A_q/I_q$ which is an isomorphism after tensoring over $R$ with $K$. Thus we are done if $A_q/(f)$ is $R_p$-flat. This follows from Algebra, Lemma 127.5 and our choice of $f$. □
9. Relative effective Cartier divisors

Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. Let $D \subset X$ be a closed subspace. Assume

1. $D$ is an effective Cartier divisor, and
2. $D \to Y$ is a flat morphism.

Then for every morphism of schemes $g : Y' \to Y$ the pullback $(g')^{-1}D$ is an effective Cartier divisor on $X' = Y' \times_Y X$ where $g' : X' \to X$ is the projection.

Proof. Using Lemma 6.2 the property of being an effective Cartier divisor is étale local. Thus this lemma immediately reduces to the case of schemes which is Divisors, Lemma 18.1. □

This lemma is the motivation for the following definition.

Definition 9.2. Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. A relative effective Cartier divisor on $X/Y$ is an effective Cartier divisor $D \subset X$ such that $D \to Y$ is a flat morphism of algebraic spaces.

10. Meromorphic functions and sections

This section is the analogue of Divisors, Section 23. Beware: it is even easier to make mistakes with this material in the case of algebraic space, than it is in the case of schemes!

Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. For any scheme $U$ étale over $X$ we have defined the set $S(U) \subset O_X(U)$ of regular sections of $O_X$ over $U$, see Definition 7.4. The restriction of a regular section to $V/U$ étale is regular. Hence $S : U \mapsto S(U)$ is a subsheaf (of sets) of $O_X$. We sometimes denote $S = S_X$ if we want to indicate the dependence on $X$. Moreover, $S(U)$ is a multiplicative subset of the ring $O_X(U)$ for each $U$. Hence we may consider the presheaf of rings

$U \mapsto S(U)^{-1}O_X(U)$,

on $X_{\text{étale}}$ and its sheafification, see Modules on Sites, Section 43.

Definition 10.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. The sheaf of meromorphic functions on $X$ is the sheaf $\mathcal{K}_X$ on $X_{\text{étale}}$ associated to the presheaf displayed above. A meromorphic function on $X$ is a global section of $\mathcal{K}_X$.

Since each element of each $S(U)$ is a nonzerodivisor on $O_X(U)$ we see that the natural map of sheaves of rings $O_X \to \mathcal{K}_X$ is injective. Moreover, by the compatibility of sheafification and taking stalks we see that

$\mathcal{K}_{X,\mathfrak{p}} = S_{\mathfrak{p}}^{-1}O_{X,\mathfrak{p}}$

for any geometric point $\mathfrak{p}$ of $X$. The set $S_{\mathfrak{p}}$ is a subset of the set of nonzerodivisors of $O_{X,\mathfrak{p}}$, but in general not equal to this.

Lemma 10.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. For $U$ affine and étale over $X$ the set $S_X(U)$ is the set of nonzerodivisors in $O_X(U)$.

Proof. Follows from Lemma 7.6. □
Next, let $\mathcal{F}$ be a sheaf of $\mathcal{O}_X$-modules on $X_{\text{étale}}$. Consider the presheaf $U \mapsto S(U)^{-1}\mathcal{F}(U)$. Its sheafification is the sheaf $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{K}_X$, see Modules on Sites, Lemma 43.2.

**Definition 10.3.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_X$-modules on $X_{\text{étale}}$.

1. We denote $\mathcal{K}_X(\mathcal{F})$ the sheaf of $\mathcal{K}_X$-modules which is the sheafification of the presheaf $U \mapsto S(U)^{-1}\mathcal{F}(U)$. Equivalently $\mathcal{K}_X(\mathcal{F}) = \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{K}_X$ (see above).
2. A meromorphic section of $\mathcal{F}$ is a global section of $\mathcal{K}_X(\mathcal{F})$.

In particular we have

$$\mathcal{K}_X(\mathcal{F})_{\mathfrak{p}} = \mathcal{F}_{\mathfrak{p}} \otimes_{\mathcal{O}_{X,\mathfrak{p}}} \mathcal{K}_{X,\mathfrak{p}} = S_{\mathfrak{p}}^{-1}\mathcal{F}_{\mathfrak{p}}$$

for any geometric point $\mathfrak{p}$ of $X$. However, one has to be careful since it may not be the case that $S_{\mathfrak{p}}$ is the set of nonzerodivisors in the étale local ring $\mathcal{O}_{X,\mathfrak{p}}$ as we pointed out above. The sheaves of meromorphic sections aren’t quasi-coherent modules in general, but they do have some properties in common with quasi-coherent modules.

**Lemma 10.4.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Assume

1. every weakly associated point of $X$ is a point of codimension 0, and
2. $X$ satisfies the equivalent conditions of Morphisms of Spaces, Lemma 49.1.

Then

1. $\mathcal{K}_X$ is a quasi-coherent sheaf of $\mathcal{O}_X$-algebras,
2. for $U \in X_{\text{étale}}$ affine $\mathcal{K}_X(U)$ is the total ring of fractions of $\mathcal{O}_X(U)$,
3. for a geometric point $\mathfrak{p}$ the set $S_{\mathfrak{p}}$ the set of nonzerodivisors of $\mathcal{O}_{X,\mathfrak{p}}$, and
4. for a geometric point $\mathfrak{p}$ the ring $\mathcal{K}_{X,\mathfrak{p}}$ is the total ring of fractions of $\mathcal{O}_{X,\mathfrak{p}}$.

**Proof.** By Lemma 7.5 we see that $U \in X_{\text{étale}}$ affine $S_{\mathfrak{p}}(U) \subset \mathcal{O}_X(U)$ is the set of nonzerodivisors in $\mathcal{O}_X(U)$. Thus the presheaf $S^{-1}\mathcal{O}_X$ is equal to

$$U \mapsto Q(\mathcal{O}_X(U))$$

on $X_{\text{affine, étale}}$, with notation as in Algebra, Example 9.8. Observe that the codimension 0 points of $X$ correspond to the generic points of $U$, see Properties of Spaces, Lemma 11.1. Hence if $U = \text{Spec}(A)$, then $A$ is a ring with finitely many minimal primes such that any weakly associated prime of $A$ is minimal. The same is true for any étale extension of $A$ (because the spectrum of such is an affine scheme étale over $X$ hence can play the role of $A$ in the previous sentence). In order to show that our presheaf is a sheaf and quasi-coherent it suffices to show that

$$Q(A) \otimes_A B \longrightarrow Q(B)$$

is an isomorphism when $A \to B$ is an étale ring map, see Properties of Spaces, Lemma 29.3. (To define the displayed arrow, observe that since $A \to B$ is flat it maps nonzerodivisors to nonzerodivisors.) By Algebra, Lemmas 24.4 and 65.7 we have

$$Q(A) = \prod_{p \subset A \text{ minimal}} A_p \quad \text{and} \quad Q(B) = \prod_{q \subset B \text{ minimal}} B_q$$

Since $A \to B$ is étale, the minimal primes of $B$ are exactly the primes of $B$ lying over the minimal primes of $A$ (for example by More on Algebra, Lemma 43.2). By Algebra, Lemmas 148.10, 148.3 (13), and 148.5 we see that $A_p \otimes_A B$ is a finite
product of local rings finite étale over $A$. This clearly implies that $A_p \otimes_A B = \prod q$ lies over $pB_q$ as desired.

At this point we know that (1) and (2) hold. Proof of (3). Let $s \in O_X, x$ be a nonzerodivisor. Then we can find an étale neighbourhood $(U, \pi) \to (X, \pi)$ and $f \in O_X(U)$ mapping to $s$. Let $u \in U$ be the point determined by $u$. Since $O_{U, u} \to O_X, x$ is faithfully flat (as a strict henselization), we see that $f$ maps to a nonzerodivisor in $O_{U, u}$. By Divisors, Lemma 23.6 after shrinking $U$ we find that $f$ is a nonzerodivisor and hence a section of $S_X(U)$. Part (4) follows from (3) by computing stalks.

\[\square\]

**Lemma 10.5.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Assume

\begin{enumerate}[(a)]
  \item every weakly associated point of $X$ is a point of codimension 0, and
  \item $X$ satisfies the equivalent conditions of Morphisms of Spaces, Lemma 49.1,
  \item $X$ is representable by a scheme $X_0$ (awkward but temporary notation).
\end{enumerate}

Then the sheaf of meromorphic functions $K_X$ is the quasi-coherent sheaf of $O_X$-algebras associated to the quasi-coherent sheaf of meromorphic functions $K_{X_0}$.

**Proof.** For the equivalence between $QCoh(O_X)$ and $QCoh(O_{X_0})$, please see Properties of Spaces, Section 29. The lemma is true because $K_X$ and $K_{X_0}$ are quasi-coherent and have the same value on corresponding affine opens of $X$ and $X_0$ by Lemma 10.4 and Divisors, Lemma 23.6.

\[\square\]

**Definition 10.6.** Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. We say that pullbacks of meromorphic functions are defined for $f$ if for every commutative diagram

\[
\begin{array}{ccc}
U & \longrightarrow & X \\
\downarrow & & \downarrow \\
V & \longrightarrow & Y
\end{array}
\]

with $U \in X_{\text{étale}}$ and $V \in Y_{\text{étale}}$ and any section $s \in S_Y(V)$ the pullback $f^! (s) \in O_X(U)$ is an element of $S_X(U)$.

In this case there is an induced map $f^! : f_{\text{small}}^* K_Y \to K_X$, in other words we obtain a commutative diagram of morphisms of ringed topoi

\[
\begin{array}{ccc}
(Sh(X_{\text{étale}}, K_X)) & \longrightarrow & (Sh(X_{\text{étale}}, O_X)) \\
\downarrow f_{\text{small}} & & \downarrow f_{\text{small}} \\
(Sh(Y_{\text{étale}}, K_Y)) & \longrightarrow & (Sh(Y_{\text{étale}}, O_Y))
\end{array}
\]

We sometimes denote $f^*(s) = f^!(s)$ for a section $s \in \Gamma(Y, K_Y)$.

**Lemma 10.7.** Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. Pullbacks of meromorphic sections are defined in each of the following cases

\begin{enumerate}
  \item weakly associated points of $X$ are mapped to points of codimension 0 on $Y$,
  \item $f$ is flat,
  \item add more here as needed.
\end{enumerate}
Proof. Working étale locally, this translates into the case of schemes, see Divisors, Lemma 23.3. To do the translation use Lemma 7.5 (description of regular sections), Definition 2.2 (definition of weakly associated points), and Properties of Spaces, Lemma 11.1 (description of codimension 0 points).

0ENA Lemma 10.8. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Assume
\begin{enumerate}[(a)]
  \item every weakly associated point of $X$ is a point of codimension 0, and
  \item $X$ satisfies the equivalent conditions of Morphisms of Spaces, Lemma 49.1,
  \item every codimension 0 point of $X$ can be represented by a monomorphism $\text{Spec}(k) \to X$.
\end{enumerate}
Let $X^0 \subset |X|$ be the set of codimension 0 points of $X$. Then we have
\[ \mathcal{K}_X = \bigoplus_{\eta \in X^0} j_{\eta*}\mathcal{O}_{X,\eta} = \prod_{\eta \in X^0} j_{\eta*}\mathcal{O}_{X,\eta}, \]
where $j_{\eta} : \text{Spec}(\mathcal{O}_{X,\eta}) \to X$ is the canonical map of Schemes, Section 13, this makes sense because $X^0$ is contained in the schematic locus of $X$. Similarly, for every quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ we obtain the formula
\[ \mathcal{K}_X(\mathcal{F}) = \bigoplus_{\eta \in X^0} j_{\eta*}\mathcal{F}_{\eta} = \prod_{\eta \in X^0} j_{\eta*}\mathcal{F}_{\eta}, \]
for the sheaf of meromorphic sections of $\mathcal{F}$. Finally, the ring of rational functions of $X$ is the ring of meromorphic functions on $X$, in a formula: $R(X) = \Gamma(X, \mathcal{K}_X)$.

Proof. By Decent Spaces, Lemma 20.3 and Section 6 we see that $X$ is decent.

Thus $X^0 \subset |X|$ is the set of generic points of irreducible components (Decent Spaces, Lemma 20.1) and $X^0$ is locally finite in $|X|$ by (b). It follows that $X^0$ is contained in every dense open subset of $|X|$. In particular, $X^0$ is contained in the schematic locus (Decent Spaces, Theorem 10.2). Thus the local rings $\mathcal{O}_{X,\eta}$ and the morphisms $j_{\eta}$ are defined.

Observe that a locally finite direct sum of sheaves of modules is equal to the product. This and the fact that $X^0$ is locally finite in $|X|$ explains the equalities between direct sums and products in the statement. Then since $\mathcal{K}_X = \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{K}_X$ we see that the second equality follows from the first.

Let $j : Y = \bigsqcup_{\eta \in X^0} \text{Spec}(\mathcal{O}_{X,\eta}) \to X$ be the product of the morphisms $j_{\eta}$. We have to show that $\mathcal{K}_X = j_*\mathcal{O}_Y$. Observe that $\mathcal{K}_Y = \mathcal{O}_Y$ as $Y$ is a disjoint union of spectra of local rings of dimension 0: in a local ring of dimension zero any nonzerodivisor is a unit. Next, note that pullbacks of meromorphic functions are defined for $j$ by Lemma 10.7. This gives a map
\[ \mathcal{K}_X \to j_*\mathcal{O}_Y. \]

Let $U \in X_{\text{étale}}$ be affine. By Lemma 10.4 the left hand side evaluates to total ring of fractions of $\mathcal{O}_X(U)$. On the other hand, the right hand side is equal to the product of the local rings of $U$ at the codimension 0 points, i.e., the generic points of $U$. These two rings are equal (as we already saw in the proof of Lemma 10.4) by Algebra, Lemmas 24.4 and 65.7. Thus our map is an isomorphism.

Finally, we have to show that $R(X) = \Gamma(X, \mathcal{K}_X)$. This follows from the case of schemes (Divisors, Lemma 23.6) applied to the schematic locus $X' \subset X$. Namely, the ring of rational functions of $X$ is by definition the same as the ring of rational functions on $X'$ as it is a dense open subspace of $X$ (see above). Certainly, $R(X')$

\footnote{Conversely, if $X$ is decent, then condition (c) holds automatically.}
agrees with the ring of rational functions when $X'$ is viewed as a scheme. On the other hand, by our description of $K_X$ above, and the fact, seen above, that $X^0 \subset |X'|$ is contained in any dense open, we see that $\Gamma(X, K_X) = \Gamma(X', K_{X'})$. Finally, use the compatibility recorded in Lemma 10.5. □

**Definition 10.9.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $L$ be an invertible $O_X$-module. A meromorphic section $s$ of $L$ is said to be regular if the induced map $K_X \to K_X(L)$ is injective.

Let us spell out when (regular) meromorphic sections can be pulled back.

**Lemma 10.10.** Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. Assume that pullbacks of meromorphic functions are defined for $f$ (see Definition 10.6).

1. Let $F$ be a sheaf of $O_Y$-modules. There is a canonical pullback map $f^* : \Gamma(Y, K_Y(F)) \to \Gamma(X, K_X(f^*F))$ for meromorphic sections of $F$.

2. Let $L$ be an invertible $O_X$-module. A regular meromorphic section $s$ of $L$ pulls back to a regular meromorphic section $f^*s$ of $f^*L$.

**Proof.** Omitted. □

**Lemma 10.11.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$ satisfying (a), (b), and (c) of Lemma 10.8. Then every invertible $O_X$-module $L$ has a regular meromorphic section.

**Proof.** With notation as in Lemma 10.8 the stalk $L_\eta$ of $L$ at is defined for all $\eta \in X^0$ and it is a rank 1 free $O_{X, \eta}$-module. Pick a generator $s_\eta \in L_\eta$ for all $\eta \in X^0$. It follows immediately from the description of $K_X$ and $K_X(L)$ in Lemma 10.8 that $s = \prod s_\eta$ is a regular meromorphic section of $L$. □

### 11. Relative Proj

This section revisits the construction of the relative proj in the setting of algebraic spaces. The material in this section corresponds to the material in Constructions, Section 16 and Divisors, Section 30 in the case of schemes.

**Situation 11.1.** Here $S$ is a scheme, $X$ is an algebraic space over $S$, and $A$ is a quasi-coherent graded $O_X$-algebra.

In Situation 11.1 we are going to define a functor $F : (Sch/S)^{opp}_{fppf} \to Sets$ which will turn out to be an algebraic space. We will follow (mutatis mutandis) the procedure of Constructions, Section 16. First, given a scheme $T$ over $S$ we define a quadruple over $T$ to be a system $(d, f : T \to X, L, \psi)$

1. $d \geq 1$ is an integer,
2. $f : T \to X$ is a morphism over $S$,
3. $L$ is an invertible $O_T$-module, and
4. $\psi : f^*A(d) \to \text{\bigoplus}_{n \geq 0} L^{\otimes n}$ is a homomorphism of graded $O_T$-algebras such that $f^*A_d \to L$ is surjective.

We say two quadruples $(d, f, L, \psi)$ and $(d', f', L', \psi')$ are equivalent if and only if we have $f = f'$ and for some positive integer $m = ad = a'd'$ there exists an

---

2This definition is motivated by Constructions, Lemma 16.4. The advantage of choosing this one is that it clearly defines an equivalence relation.
isomorphism $\beta : L^a \to (L')^a$ with the property that $\beta \circ \psi|_{f^*A^{(m)}}$ and $\psi'|_{f^*A^{(m)}}$ agree as graded ring maps $f^*A^{(m)} \to \bigoplus_{n \geq 0}(L')^a$. Given a quadruple $(d, f, L, \psi)$ and a morphism $h : T' \to T$ we have the pullback $(d, f \circ h, h^*L, h^*\psi)$. Pullback preserves the equivalence relation. Finally, for a quasi-compact scheme $T$ over $S$ we set

$$F(T) = \text{the set of equivalence classes of quadruples over } T$$

and for an arbitrary scheme $T$ over $S$ we set

$$F(T) = \lim_{V \subset T \text{ quasi-compact open}} F(V).$$

In other words, an element $\xi$ of $F(T)$ corresponds to a compatible system of choices of elements $\xi_V \in F(V)$ where $V$ ranges over the quasi-compact opens of $T$. Thus we have defined our functor

$$F : \text{Sch}^{opp} \longrightarrow \text{Sets}$$

There is a morphism $F \to X$ of functors sending the quadruple $(d, f, L, \psi)$ to $f$.

**Lemma 11.2.** In Situation 11.1. The functor $F$ above is an algebraic space. For any morphism $g : Z \to X$ where $Z$ is a scheme there is a canonical isomorphism $\text{Proj}_Z(g^*A) = Z \times_X F$ compatible with further base change.

**Proof.** It suffices to prove the second assertion, see Spaces, Lemma 11.3. Let $g : Z \to X$ be a morphism where $Z$ is a scheme. Let $F'$ be the functor of quadruples associated to the graded quasi-coherent $O_X$-algebra $g^*A$. Then there is a canonical isomorphism $F' = Z \times_X F$, sending a quadruple $(d, f : T \to Z, L, \psi)$ for $F'$ to $(d, g \circ f, L, \psi)$ (details omitted, see proof of Constructions, Lemma 16.1). By Constructions, Lemmas 16.4, 16.5, and 16.6 and Definition 16.7 we see that $F'$ is representable by $\text{Proj}_Z(g^*A)$.

The lemma above tells us the following definition makes sense.

**Definition 11.3.** Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $A$ be a quasi-coherent sheaf of graded $O_X$-algebras. The *relative homogeneous spectrum of $A$ over $X$*, or the *homogeneous spectrum of $A$ over $X$*, or the relative $\text{Proj}$ of $A$ over $X$ is the algebraic space $F$ over $X$ of Lemma 11.2. We denote it $\pi : \text{Proj}_X(A) \to X$.

In particular the structure morphism of the relative $\text{Proj}$ is representable by construction. We can also think about the relative $\text{Proj}$ via gluing. Let $\varphi : U \to X$ be a surjective étale morphism, where $U$ is a scheme. Set $R = U \times_X U$ with projection morphisms $s, t : R \to U$. By Lemma 11.2 there exists a canonical isomorphism

$$\gamma : \text{Proj}_R(\varphi^*A) \longrightarrow \text{Proj}_X(A) \times_X U$$
over $U$. Let $\alpha : t^*\varphi^*A \to s^*\varphi^*A$ be the canonical isomorphism of Properties of Spaces, Proposition $32.1$. Then the diagram

\[
\begin{array}{ccc}
\text{Proj}_U(\varphi^*A) \times_U R & \overset{\alpha}{\longrightarrow} & \text{Proj}_R(s^*\varphi^*A) \\
\downarrow^{s^*\gamma} & & \downarrow_{}^{\text{induced by } \alpha} \\
\text{Proj}_X(A) \times_X R & \overset{t^*\gamma}{\longrightarrow} & \text{Proj}_R(t^*\varphi^*A)
\end{array}
\]

is commutative (the equal signs come from Constructions, Lemma $16.10$). Thus, if we denote $A_U$, $A_R$ the pullback of $A$ to $U$, $R$, then $P = \text{Proj}_X(A)$ has an étale covering by the scheme $P_U = \text{Proj}_U(A_U)$ and $P_U \times_P P_U$ is equal to $P_R = \text{Proj}_R(A_R)$. Using these remarks we can argue in the usual fashion using étale localization to transfer results on the relative proj from the case of schemes to the case of algebraic spaces.

**Lemma 11.4.** In Situation $11.1$. The relative Proj comes equipped with a quasi-coherent sheaf of $\mathbb{Z}$-graded algebras $\bigoplus_{n \in \mathbb{Z}} \mathcal{O}_{\text{Proj}_X}(A)(n)$ and a canonical homomorphism of graded algebras

\[\psi : \pi^*A \longrightarrow \bigoplus_{n \geq 0} \mathcal{O}_{\text{Proj}_X}(A)(n)\]

whose base change to any scheme over $X$ agrees with Constructions, Lemma $15.5$.

**Proof.** As in the discussion following Definition $11.3$ choose a scheme $U$ and a surjective étale morphism $U \to X$, set $R = U \times_X U$ with projections $s, t : R \to U$, $A_U = A|_U$, $A_R = A|_R$, and $\pi : P = \text{Proj}_X(A) \to X$, $\pi_U : P_U = \text{Proj}_U(A_U)$ and $\pi_R : P_R = \text{Proj}_R(A_R)$. By the Constructions, Lemma $15.5$ we have a quasi-coherent sheaf of $\mathbb{Z}$-graded $\mathcal{O}_{P_U}$-algebras $\bigoplus_{n \in \mathbb{Z}} \mathcal{O}_{P_U}(n)$ and a canonical map $\psi_U : \pi^*_U A_U \to \bigoplus_{n \geq 0} \mathcal{O}_{P_U}(n)$ and similarly for $P_R$. By Constructions, Lemma $16.10$ the pullback of $\mathcal{O}_{P_U}(n)$ and $\psi_U$ by either projection $P_R \to P_U$ is equal to $\mathcal{O}_{P_R}(n)$ and $\psi_R$. By Properties of Spaces, Proposition $32.1$ we obtain $\mathcal{O}_{P}(n)$ and $\psi$. We omit the verification of compatibility with pullback to arbitrary schemes over $X$. □

Having constructed the relative Proj we turn to some basic properties.

**Lemma 11.5.** Let $S$ be a scheme. Let $g : X' \to X$ be a morphism of algebraic spaces over $S$ and let $A$ be a quasi-coherent sheaf of graded $\mathcal{O}_X$-algebras. Then there is a canonical isomorphism

\[r : \text{Proj}_{X'}(g^*A) \longrightarrow X' \times_X \text{Proj}_X(A)\]

as well as a corresponding isomorphism

\[\theta : r^*pr_2^* \left( \bigoplus_{d \in \mathbb{Z}} \mathcal{O}_{\text{Proj}_{X'}(A)}(d) \right) \longrightarrow \bigoplus_{d \in \mathbb{Z}} \mathcal{O}_{\text{Proj}_{X'}(g^*A)}(d)\]

of $\mathbb{Z}$-graded $\mathcal{O}_{\text{Proj}_{X'}(g^*A)}$-algebras.

**Proof.** Let $F$ be the functor $11.1.1$ and let $F'$ be the corresponding functor defined using $g^*A$ on $X'$. We claim there is a canonical isomorphism $r : F' \to X' \times_X F$ of functors (and of course $r$ is the isomorphism of the lemma). It suffices
to construct the bijection \( r : F'(T) \to X'(T) \times_{X(T)} F(T) \) for quasi-compact schemes \( T \) over \( S \). First, if \( \xi = (d', f', \mathcal{L}', \psi') \) is a quadruple over \( T \) for \( F' \), then we can set \( r(\xi) = (f', (d', g \circ f', \mathcal{L}', \psi')) \). This makes sense as \((g \circ f')^* A^{(d')} = (f')^* (g^* A)^{(d')}\). The inverse map sends the pair \((f', (d, f, \mathcal{L}, \psi))\) to the quadruple \((d, f', \mathcal{L}, \psi)\). We omit the proof of the final assertion (hint: reduce to the case of schemes by étale localization and apply Constructions, Lemma \[16.10\].

\[084E\] **Lemma 11.6.** In Situation \[11.1\] the morphism \( \pi : \text{Proj}_X(A) \to X \) is separated.

**Proof.** By Morphisms of Spaces, Lemma \[4.12\] and the construction of the relative \( \text{Proj} \) this follows from the case of schemes which is Constructions, Lemma \[16.9\].

\[084F\] **Lemma 11.7.** In Situation \[11.1\] If one of the following holds

1. \( A \) is of finite type as a sheaf of \( \mathcal{A}_0 \)-algebras,
2. \( A \) is generated by \( \mathcal{A}_1 \) as an \( \mathcal{A}_0 \)-algebra and \( \mathcal{A}_1 \) is a finite type \( \mathcal{A}_0 \)-module,
3. there exists a finite type quasi-coherent \( \mathcal{A}_0 \)-submodule \( \mathcal{F} \subset \mathcal{A}_1 \) such that \( \mathcal{A}_1/\mathcal{F} \mathcal{A} \) is a locally nilpotent sheaf of ideals of \( \mathcal{A}/\mathcal{F} \mathcal{A} \),
then \( \pi : \text{Proj}_X(A) \to X \) is quasi-compact.

**Proof.** By Morphisms of Spaces, Lemma \[8.8\] and the construction of the relative \( \text{Proj} \) this follows from the case of schemes which is Divisors, Lemma \[30.1\].

\[084G\] **Lemma 11.8.** In Situation \[11.1\] If \( A \) is of finite type as a sheaf of \( \mathcal{O}_X \)-algebras, then \( \pi : \text{Proj}_X(A) \to X \) is of finite type.

**Proof.** By Morphisms of Spaces, Lemma \[23.4\] and the construction of the relative \( \text{Proj} \) this follows from the case of schemes which is Divisors, Lemma \[30.2\].

\[084H\] **Lemma 11.9.** In Situation \[11.1\] If \( \mathcal{O}_X \to \mathcal{A}_0 \) is an integral algebra map\(^3\) and \( A \) is of finite type as an \( \mathcal{A}_0 \)-algebra, then \( \pi : \text{Proj}_X(A) \to X \) is universally closed.

**Proof.** By Morphisms of Spaces, Lemma \[9.5\] and the construction of the relative \( \text{Proj} \) this follows from the case of schemes which is Divisors, Lemma \[30.3\].

\[084I\] **Lemma 11.10.** In Situation \[11.1\] The following conditions are equivalent

1. \( \mathcal{A}_0 \) is a finite type \( \mathcal{O}_X \)-module and \( A \) is of finite type as an \( \mathcal{A}_0 \)-algebra,
2. \( \mathcal{A}_0 \) is a finite type \( \mathcal{O}_X \)-module and \( A \) is of finite type as an \( \mathcal{O}_X \)-algebra.

If these conditions hold, then \( \pi : \text{Proj}_X(A) \to X \) is proper.

**Proof.** By Morphisms of Spaces, Lemma \[40.2\] and the construction of the relative \( \text{Proj} \) this follows from the case of schemes which is Divisors, Lemma \[30.3\].

\[085D\] **Lemma 11.11.** Let \( S \) be a scheme. Let \( X \) be an algebraic space over \( S \). Let \( A \) be a quasi-coherent sheaf of graded \( \mathcal{O}_X \)-modules generated as an \( \mathcal{A}_0 \)-algebra by \( \mathcal{A}_1 \). With \( P = \text{Proj}_X(A) \) we have

1. \( P \) represents the functor \( F_1 \) which associates to \( T \) over \( S \) the set of isomorphism classes of triples \((f, \mathcal{L}, \psi)\), where \( f : T \to X \) is a morphism over \( S \), \( \mathcal{L} \) is an invertible \( \mathcal{O}_T \)-module, and \( \psi : f^* \mathcal{A} \to \bigoplus_{n \geq 0} \mathcal{L}^\otimes n \) is a map of graded \( \mathcal{O}_T \)-algebras inducing a surjection \( f^* \mathcal{A}_1 \to \mathcal{L} \).
2. the canonical map \( \pi^* \mathcal{A}_1 \to \mathcal{O}_P(1) \) is surjective, and

\(^3\)In other words, the integral closure of \( \mathcal{O}_X \) in \( \mathcal{A}_0 \), see Morphisms of Spaces, Definition \[18.2\] equals \( \mathcal{A}_0 \).
(3) each \( \mathcal{O}_P(n) \) is invertible and the multiplication maps induce isomorphisms 
\( \mathcal{O}_P(n) \otimes_{\mathcal{O}_P} \mathcal{O}_P(m) = \mathcal{O}_P(n + m) \).

**Proof.** Omitted. See Constructions, Lemma 16.11 for the case of schemes. \( \square \)

### 12. Functoriality of relative proj

This section is the analogue of Constructions, Section 18.

**Lemma 12.1.** Let \( S \) be a scheme. Let \( X \) be an algebraic space over \( S \). Let \( \psi : A \to B \) be a map of quasi-coherent graded \( \mathcal{O}_X \)-algebras. Set \( P = \text{Proj}_X(A) \to X \) and \( Q = \text{Proj}_X(B) \to X \). There is a canonical open subspace \( U(\psi) \subset Q \) and a canonical morphism of algebraic spaces 
\( r_\psi : U(\psi) \to P \)
over \( X \) and a map of \( \mathbb{Z} \)-graded \( \mathcal{O}_{U(\psi)} \)-algebras
\[ \theta = \theta_\psi : r_\psi^* \left( \bigoplus_{d \in \mathbb{Z}} \mathcal{O}_P(d) \right) \to \bigoplus_{d \in \mathbb{Z}} \mathcal{O}_{U(\psi)}(d). \]

The triple \( (U(\psi), r_\psi, \theta) \) is characterized by the property that for any scheme \( W \) étale over \( X \) the triple
\[ (U(\psi) \times_X W, r_\psi|_{U(\psi) \times_X W} : U(\psi) \times_X W \to P \times_X W; \theta|_{U(\psi) \times_X W}) \]
is equal to the triple associated to \( \psi : A|_W \to B|_W \) of Constructions, Lemma 18.1.

**Proof.** This lemma follows from étale localization and the case of schemes, see discussion following Definition 11.3. Details omitted. \( \square \)

**Lemma 12.2.** Let \( S \) be a scheme. Let \( X \) be an algebraic space over \( S \). Let \( A, B, \) and \( C \) be quasi-coherent graded \( \mathcal{O}_X \)-algebras. Set \( P = \text{Proj}_X(A) \), \( Q = \text{Proj}_X(B) \), and \( R = \text{Proj}_X(C) \). Let \( \varphi : A \to B \), \( \psi : B \to C \) be graded \( \mathcal{O}_X \)-algebra maps. Then we have 
\[ U(\psi \circ \varphi) = r_\varphi^{-1}(U(\psi)) \quad \text{and} \quad r_{\psi \circ \varphi} = r_\varphi \circ r_\psi|_{U(\psi \circ \varphi)}. \]
In addition we have
\[ \theta_\psi \circ r_\varphi^* \theta_\varphi = \theta_{\psi \circ \varphi} \]
with obvious notation.

**Proof.** Omitted. \( \square \)

**Lemma 12.3.** With hypotheses and notation as in Lemma 12.1 above. Assume \( A_d \to B_d \) is surjective for \( d \gg 0 \). Then

(1) \( U(\psi) = Q \),

(2) \( r_\psi : Q \to R \) is a closed immersion, and

(3) the maps \( \theta : r_\psi^* \mathcal{O}_P(n) \to \mathcal{O}_Q(n) \) are surjective but not isomorphisms in general (even if \( A \to B \) is surjective).

**Proof.** Follows from the case of schemes (Constructions, Lemma 18.3) by étale localization. \( \square \)

**Lemma 12.4.** With hypotheses and notation as in Lemma 12.1 above. Assume \( A_d \to B_d \) is an isomorphism for all \( d \gg 0 \). Then

(1) \( U(\psi) = Q \),

(2) \( r_\psi : Q \to P \) is an isomorphism, and

(3) the maps \( \theta : r_\psi^* \mathcal{O}_P(n) \to \mathcal{O}_Q(n) \) are isomorphisms.
**Proof.** Follows from the case of schemes (Constructions, Lemma 18.4) by étale localization.

**Lemma 12.5.** With hypotheses and notation as in Lemma 12.1 above. Assume $A_d \to B_d$ is surjective for $d \gg 0$ and that $A$ is generated by $A_1$ over $A_0$. Then

1. $U(\psi) = Q$,
2. $r_\psi : Q \to P$ is a closed immersion, and
3. the maps $\theta : r_\psi^* \mathcal{O}_P(n) \to \mathcal{O}_Q(n)$ are isomorphisms.

**Proof.** Follows from the case of schemes (Constructions, Lemma 18.5) by étale localization.

---

13. Invertible sheaves and morphisms into relative Proj

**Lemma 13.1.** With assumptions and notation as above. The morphism $\psi$ induces a canonical morphism of algebraic spaces over $Y$

$$r_{\mathcal{L},\psi} : U(\psi) \longrightarrow \text{Proj}_Y(A)$$

together with a map of graded $\mathcal{O}_{U(\psi)}$-algebras

$$\theta : r_{\mathcal{L},\psi}^* \left( \bigoplus_{d \geq 0} \mathcal{O}_{\text{Proj}_Y(A)}(d) \right) \longrightarrow \bigoplus_{d \geq 0} \mathcal{L}^{\otimes d}|_{U(\psi)}$$

classified by the following properties:

1. For $V \to Y$ étale and $d \geq 0$ the diagram

$$\begin{array}{ccc}
A_d(V) & \xrightarrow{\psi} & \Gamma(V \times_Y X, \mathcal{L}^{\otimes d}) \\
\downarrow & & \downarrow \text{restrict} \\
\Gamma(V \times_Y \text{Proj}_Y(A), \mathcal{O}_{\text{Proj}_Y(A)}(d)) & \xrightarrow{\theta} & \Gamma(V \times_Y U(\psi), \mathcal{L}^{\otimes d})
\end{array}$$

is commutative.

2. For any $d \geq 1$ and any morphism $W \to X$ where $W$ is a scheme such that $\psi|_W : f^* A_d|_W \to \mathcal{L}^{\otimes d}|_W$ is surjective we have (a) $W \to X$ factors through $U(\psi)$ and (b) composition of $W \to U(\psi)$ with $r_{\mathcal{L},\psi}$ agrees with the morphism $W \to \text{Proj}_Y(A)$ which exists by the construction of $\text{Proj}_Y(A)$, see Definition 11.3.
Consider a commutative diagram

\[
\begin{array}{ccc}
X' & \longrightarrow & X \\
\downarrow f' & & \downarrow f \\
Y' & \longrightarrow & Y
\end{array}
\]

where \(X' \) and \(Y' \) are schemes, set \(A' = g^* A \) and \(L' = (g')^* L \) and denote \(\psi' : (f')^* A \to \bigoplus_{d \geq 0} (L')^d \) the pullback of \(\psi \). Let \(U(\psi') \), \(r_{\psi',L'} \), and \(\theta' \) be the open, morphism, and homomorphism constructed in Constructions, Lemma 13.1. Then \(U(\psi') = (g')^{-1}(U(\psi))\) and \(r_{\psi',L'} \) agrees with the base change of \(r_{\psi,L} \) via the isomorphism \(\text{Proj}_Y'(A') = Y' \times_Y \text{Proj}_Y(A)\) of Lemma 11.5. Moreover, \(\theta' \) is the pullback of \(\theta \).

**Proof.** omitted. Hints: First we observe that for a quasi-compact scheme \(W \) over \(X \) the following are equivalent

1. \(W \to X\) factors through \(U(\psi)\), and
2. there exists a \(d \) such that \(\psi|_W : f^*A_d|_W \to (L^d)|_W \) is surjective.

This gives a description of \(U(\psi)\) as a subfunctor of \(X\) on our base category \((\text{Sch}/S)_{fppf}\).

For such a \(W \) and \(d \) we consider the quadruple \((d,W \to Y,L|_W,\psi|_W)\). By definition of \(\text{Proj}_Y'(A)\) we obtain a morphism \(W \to \text{Proj}_Y(A)\). By our notion of equivalence of quadruples one sees that this morphism is independent of the choice of \(d\). This clearly defines a transformation of functors \(r_{\psi,L} : U(\psi) \to \text{Proj}_Y(A)\), i.e., a morphism of algebraic spaces. By construction this morphism satisfies (2).

Since the morphism constructed in Constructions, Lemma 19.1 satisfies the same property, we see that (3) is true.

To construct \(\theta \) and check the compatibility (1) of the lemma, work étale locally on \(Y\) and \(X\), arguing as in the discussion following Definition 11.3.

### 14. Relatively ample sheaves

This section is the analogue of Morphisms, Section 35 for algebraic spaces. Our definition of a relatively ample invertible sheaf is as follows.

**Definition 14.1.** Let \(S\) be a scheme. Let \(f : X \to Y\) be a morphism of algebraic spaces over \(S\). Let \(L\) be an invertible \(O_X\)-module. We say \(L\) is relatively ample, or \(f\)-relatively ample, or ample on \(X/Y\), or \(f\)-ample if \(f : X \to Y\) is representable and for every morphism \(Z \to Y\) where \(Z\) is a scheme, the pullback \(L_Z \) of \(L\) to \(X_Z = Z \times_Y X\) is ample on \(X_Z/Z\) as in Morphisms, Definition 35.1.

We will almost always reduce questions about relatively ample invertible sheaves to the case of schemes. Thus in this section we have mainly sanity checks.

**Lemma 14.2.** Let \(S\) be a scheme. Let \(f : X \to Y\) be a morphism of algebraic spaces over \(S\). Let \(L\) be an invertible \(O_X\)-module. Assume \(Y\) is a scheme. The following are equivalent

1. \(L\) is ample on \(X/Y\) in the sense of Definition 14.1 and
2. \(X\) is a scheme and \(L\) is ample on \(X/Y\) in the sense of Morphisms, Definition 35.1.

**Proof.** This follows from the definitions and Morphisms, Lemma 35.9 (which says that being relatively ample for schemes is preserved under base change).
Lemma 14.3. Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. Let $L$ be an invertible $\mathcal{O}_X$-module. Let $f' : X' \to Y'$ be the base change of $f$ and denote $L'$ the pullback of $L$ to $X'$. If $L$ is $f$-ample, then $L'$ is $f'$-ample.

Proof. This follows immediately from the definition! (Hint: transitivity of base change.) □

Lemma 14.4. Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. If there exists an $f$-ample invertible sheaf, then $f$ is representable, quasi-compact, and separated.

Proof. This is clear from the definitions and Morphisms, Lemma 35.3. (If in doubt, take a look at the principle of Algebraic Spaces, Lemma 5.8.) □

Lemma 14.5. Let $V \to U$ be a surjective étale morphism of affine schemes. Let $X$ be an algebraic space over $U$. Let $L$ be an invertible $\mathcal{O}_X$-module. Let $Y = V \times_U X$ and let $N$ be the pullback of $L$ to $Y$. The following are equivalent

1. $L$ is ample on $X/U$,
2. $N$ is ample on $Y/V$.

Proof. The implication (1) $\Rightarrow$ (2) follows from Lemma 14.3. Assume (2). This implies that $Y \to V$ is quasi-compact and separated (Morphisms of Spaces, Lemmas 8.8 and 4.12). Set $A = \bigoplus_{d \geq 0} f_* L^\otimes d$. Thus is a quasi-coherent sheaf of graded $\mathcal{O}_U$-algebras (Morphisms of Spaces, Lemma 11.2). By adjunction we have a map $\psi : f^* A \to \bigoplus_{d \geq 0} N^\otimes d$. Applying Lemma 13.1 we obtain an open subspace $U(\psi) \subset X$ and a morphism

$$r_{L,\psi} : U(\psi) \to \text{Proj}_U(A)$$

Since $h : V \to U$ is étale we have $A|_V = (Y \to V)_*(\bigoplus_{d \geq 0} N^\otimes d)$, see Properties of Spaces, Lemma 26.2. It follows that the pullback $\psi'$ of $\psi$ to $Y$ is the adjunction map for the situation $(Y \to V, N)$ as in Morphisms, Lemma 35.4 part (5). Since $N$ is ample on $Y/V$ we conclude from the lemma just cited that $U(\psi') = Y$ and that $r_{N,\psi'}$ is an open immersion. Since Lemma 13.1 tells us that the formation of $r_{L,\psi}$ commutes with base change, we conclude that $U(\psi) = X$ and that we have a commutative diagram

$$\begin{array}{ccc}
Y & \xrightarrow{\psi'} & \text{Proj}_V(A|_V) \to V \\
\downarrow & & \downarrow \\
X & \xrightarrow{r} & \text{Proj}_U(A) \to U
\end{array}$$

whose squares are fibre products. We conclude that $r$ is an open immersion by Morphisms of Spaces, Lemma 12.1. Thus $X$ is a scheme. Then we can apply Morphisms, Lemma 35.4 part (5) to conclude that $L$ is ample on $X/U$. □

Lemma 14.6. Let $S$ be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over $S$. Let $L$ be an invertible $\mathcal{O}_X$-module. The following are equivalent

1. $L$ is ample on $X/Y$,
2. for every scheme $Z$ and every morphism $Z \to Y$ the algebraic space $X_Z = Z \times_Y X$ is a scheme and the pullback $L_Z$ is ample on $X_Z/Z$,
(3) for every affine scheme $Z$ and every morphism $Z \to Y$ the algebraic space $X_Z = Z \times_Y X$ is a scheme and the pullback $\mathcal{L}_Z$ is ample on $X_Z/Z$,

(4) there exists a scheme $V$ and a surjective étale morphism $V \to Y$ such that the algebraic space $X_V = V \times_Y X$ is a scheme and the pullback $\mathcal{L}_V$ is ample on $X_V/V$.

**Proof.** Parts (1) and (2) are equivalent by definition. The implication (2) ⇒ (3) is immediate. If (3) holds and $Z \to Y$ is as in (2), then we see that $X_Z \to Z$ is affine locally on $Z$ representable. Hence $X_Z$ is a scheme for example by Properties of Spaces, Lemma [13.1]. Then it follows that $\mathcal{L}_Z$ is ample on $X_Z/Z$ because it holds locally on $Z$ and we can use Morphisms, Lemma [35.4]. Thus (1), (2), and (3) are equivalent. Clearly these conditions imply (4).

Assume (4). Let $Z \to Y$ be a morphism with $Z$ affine. Then $U = V \times_Y Z \to Z$ is a surjective étale morphism such that the pullback of $\mathcal{L}_Z$ by $X_U \to X_Z$ is relatively ample on $X_U/U$. Of course we may replace $U$ by an affine open. It follows that $\mathcal{L}_Z$ is ample on $X_Z/Z$ by Lemma [14.5]. Thus (4) ⇒ (3) and the proof is complete. □

15. Relative ampleness and cohomology

The following lemma is just an example of what we can do.

**Lemma 15.1.** Let $R$ be a Noetherian ring. Let $X$ be an algebraic space over $R$ such that the structure morphism $f : X \to \text{Spec}(R)$ is proper. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. The following are equivalent

1. $\mathcal{L}$ is ample on $X/R$ (Definition[14.4]),
2. for every coherent $\mathcal{O}_X$-module $\mathcal{F}$ there exists an $n_0 \geq 0$ such that $H^p(X, \mathcal{F} \otimes \mathcal{L}^{\otimes n}) = 0$ for all $n \geq n_0$ and $p > 0$.

**Proof.** The implication (1) ⇒ (2) follows from Cohomology of Schemes, Lemma [16.1] because assumption (1) implies that $X$ is a scheme. The implication (2) ⇒ (1) is Cohomology of Spaces, Lemma [16.9]. □

**Lemma 15.2.** Let $Y$ be a Noetherian scheme. Let $X$ be an algebraic space over $Y$ such that the structure morphism $f : X \to Y$ is proper. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module. Let $y \in Y$ be a point such that $X_y$ is a scheme and $\mathcal{L}_y$ is ample on $X_y$. Then there exists a $d_0$ such that for all $d \geq d_0$ we have

$$R^p f_* (\mathcal{F} \otimes \mathcal{L}^{\otimes d})_y = 0 \text{ for } p > 0$$

and the map

$$f_* (\mathcal{F} \otimes \mathcal{L}^{\otimes d})_y \to H^0(X_y, \mathcal{F}_y \otimes \mathcal{L}_y^{\otimes d})$$

is surjective.

**Proof.** Note that $\mathcal{O}_{Y,y}$ is a Noetherian local ring. Consider the canonical morphism $c : \text{Spec}(\mathcal{O}_{Y,y}) \to Y$, see Schemes, Equation [13.1.1]. This is a flat morphism as it identifies local rings. Denote momentarily $f' : X' \to \text{Spec}(\mathcal{O}_{Y,y})$ the base change of $f$ to this local ring. We see that $c^* R^p f_* \mathcal{F} = R^p f'_* \mathcal{F}'$ by Cohomology of Spaces, Lemma [11.2]. Moreover, the fibres $X_y$ and $X'_y$ are identified. Hence we may assume that $Y = \text{Spec}(A)$ is the spectrum of a Noetherian local ring $(A, \mathfrak{m}, \kappa)$ and $y \in Y$. 
corresponds to \( m \). In this case \( R^p f_*(\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^d)_y = H^p(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^d) \) for all \( p \geq 0 \). Denote \( f_y : X_y \to \text{Spec}(\kappa) \) the projection.

Let \( B = \text{Gr}_m(A) = \bigoplus_{n \geq 0} m^n/m^{n+1} \). Consider the sheaf \( B = f_y^* \tilde{B} \) of quasi-coherent graded \( \mathcal{O}_{X_y} \)-algebras. We will use notation as in Cohomology of Spaces, Section 21 with \( I \) replaced by \( m \). Since \( X_y \) is the closed subspace of \( X \) cut out by \( m\mathcal{O}_X \) we may think of \( m^n \mathcal{F}/m^{n+1} \mathcal{F} \) as a coherent \( \mathcal{O}_{X_y} \)-module, see Cohomology of Spaces, Lemma 12.8. Then \( \bigoplus_{n \geq 0} m^n \mathcal{F}/m^{n+1} \mathcal{F} \) is a quasi-coherent graded \( \mathcal{B} \)-module of finite type because it is generated in degree zero over \( \mathcal{B} \) and because the degree zero part is \( \mathcal{F}_y = \mathcal{F}/m \mathcal{F} \) which is a coherent \( \mathcal{O}_{X_y} \)-module. Hence by Cohomology of Schemes, Lemma 19.3 part (2) there exists a \( d_0 \) such that

\[
H^p(X_y, m^n \mathcal{F}/m^{n+1} \mathcal{F} \otimes_{\mathcal{O}_{X_y}} \mathcal{L}_y^d) = 0
\]

for all \( p > 0 \), \( d \geq d_0 \), and \( n \geq 0 \). By Cohomology of Spaces, Lemma 8.3 this is the same as the statement that \( H^p(X, m^n \mathcal{F}/m^{n+1} \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^d) = 0 \) for all \( p > 0 \), \( d \geq d_0 \), and \( n \geq 0 \).

Consider the short exact sequences

\[ 0 \to m^n \mathcal{F}/m^{n+1} \mathcal{F} \to \mathcal{F}/m^{n+1} \mathcal{F} \to \mathcal{F}/m^n \mathcal{F} \to 0 \]

of coherent \( \mathcal{O}_X \)-modules. Tensoring with \( \mathcal{L}^d \) is an exact functor and we obtain short exact sequences

\[ 0 \to m^n \mathcal{F}/m^{n+1} \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^d \to \mathcal{F}/m^{n+1} \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^d \to \mathcal{F}/m^n \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^d \to 0 \]

Using the long exact cohomology sequence and the vanishing above we conclude (using induction) that

1. \( H^p(X, \mathcal{F}/m^n \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^d) = 0 \) for all \( p > 0 \), \( d \geq d_0 \), and \( n \geq 0 \), and
2. \( H^0(X_y, \mathcal{F}_y \otimes_{\mathcal{O}_{X_y}} \mathcal{L}_y^d) \) is surjective for all \( d \geq d_0 \) and \( n \geq 1 \).

By the theorem on formal functions (Cohomology of Spaces, Theorem 21.5) we find that the \( m \)-adic completion of \( H^p(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^d) \) is zero for all \( d \geq d_0 \) and \( p > 0 \).

Since \( H^p(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^d) \) is a finite \( A \)-module by Cohomology of Spaces, Lemma 20.3 it follows from Nakayama’s lemma (Algebra, Lemma 19.1) that \( H^p(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^d) \) is zero for all \( d \geq d_0 \) and \( p > 0 \). For \( p = 0 \) we deduce from Cohomology of Spaces, Lemma 21.4 part (3) that \( H^0(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^d) \to H^0(X_y, \mathcal{F}_y \otimes_{\mathcal{O}_{X_y}} \mathcal{L}_y^d) \) is surjective, which gives the final statement of the lemma. \( \square \)

0D3A \textbf{Lemma 15.3.} (For a more general version see Descent on Spaces, Lemma 12.2).

Let \( Y \) be a Noetherian scheme. Let \( X \) be an algebraic space over \( Y \) such that the structure morphism \( f : X \to Y \) is proper. Let \( \mathcal{L} \) be an invertible \( \mathcal{O}_X \)-module. Let \( y \in Y \) be a point such that \( X_y \) is a scheme and \( \mathcal{L}_y \) is ample on \( X_y \). Then there is an open neighbourhood \( V \subset Y \) of \( y \) such that \( \mathcal{L}|_{f^{-1}(V)} \) is ample on \( f^{-1}(V)/V \) (as in Definition 14.4).

\textbf{Proof.} Pick \( d_0 \) as in Lemma 15.2 for \( \mathcal{F} = \mathcal{O}_X \). Pick \( d \geq d_0 \) so that we can find \( r \geq 0 \) and sections \( s_{y,0}, \ldots, s_{y,r} \in H^0(X_y, \mathcal{L}_y^d) \) which define a closed immersion

\[
\varphi_y = \varphi_{\mathcal{L}_y^d}(s_{y,0}, \ldots, s_{y,r}) : X_y \to \mathbb{P}^r_{\kappa(y)}.
\]

This is possible by Morphisms, Lemma 37.4 but we also use Morphisms, Lemma 39.7 to see that \( \varphi_y \) is a closed immersion and Constructions, Section 13 for the description of morphisms into projective space in terms of invertible sheaves and
sections. By our choice of \(d_0\), after replacing \(Y\) by an open neighbourhood of \(y\), we can choose \(s_0, \ldots, s_r \in H^0(X, \mathcal{L}^d)\) mapping to \(s_{y,0}, \ldots, s_{y,r}\). Let \(X_s \subset X\) be the open subspace where \(s_i\) is a generator of \(\mathcal{L}^d\). Since the \(s_{y,i}\) generate \(\mathcal{L}_y^d\) we see that \(|X_y| \subset U = \bigcup |X_s|\). Since \(X \to Y\) is closed, we see that there is an open neighbourhood \(y \in V \subset Y\) such that \(|f|^{-1}(V) \subset U\). After replacing \(Y\) by \(V\) we may assume that the \(s_i\) generate \(\mathcal{L}^d\). Thus we obtain a morphism

\[\varphi = \varphi_{\mathcal{L}^d, (s_0, \ldots, s_r)} : X \to \mathbb{P}^*_Y\]

with \(\mathcal{L}^d \cong \varphi^* \mathcal{O}_{\mathbb{P}^*_Y}(1)\) whose base change to \(y\) gives \(\varphi_y\) (strictly speaking we need to write out a proof that the construction of morphisms into projective space given in Constructions, Section \[\text{13}\] also works to describe morphisms of algebraic spaces into projective space; we omit the details).

We will finish the proof by a sleight of hand; the “correct” proof proceeds by directly showing that \(\varphi\) is a closed immersion after base changing to an open neighbourhood of \(y\). Namely, by Cohomology of Spaces, Lemma \[\text{22.2}\] we see that \(\varphi\) is a finite over an open neighbourhood of the fibre \(\mathbb{P}_{s(y)}^r \to Y\) above \(y\). Using that \(\mathbb{P}^r_Y \to Y\) is closed, after shrinking \(Y\) we may assume that \(\varphi\) is finite. In particular \(X\) is a scheme. Then \(\mathcal{L}^d \cong \varphi^* \mathcal{O}_{\mathbb{P}^*_Y}(1)\) is ample by the very general Morphisms, Lemma \[\text{35.7}\] \(\square\)

### 16. Closed subspaces of relative proj

#### Lemma 16.1. Let \(S\) be a scheme. Let \(X\) be an algebraic space over \(S\). Let \(\mathcal{A}\) be a quasi-coherent graded \(\mathcal{O}_X\)-algebra. Let \(\pi : P \to X\) be the relative Proj of \(\mathcal{A}\). Let \(i : Z \to P\) be a closed subspace. Denote \(\mathcal{I} \subset \mathcal{A}\) the kernel of the canonical map

\[\mathcal{A} \to \bigoplus_{d \geq 0} \pi_*(i_* \mathcal{O}_Z)(d)\]

If \(\pi\) is quasi-compact, then there is an isomorphism \(Z = \text{Proj}_X(\mathcal{A}/\mathcal{I})\).

**Proof.** The morphism \(\pi\) is separated by Lemma \[\text{11.6}\]. As \(\pi\) is quasi-compact, \(\pi_*\) transforms quasi-coherent modules into quasi-coherent modules, see Morphisms of Spaces, Lemma \[\text{11.2}\]. Hence \(\mathcal{I}\) is a quasi-coherent \(\mathcal{O}_X\)-module. In particular, \(\mathcal{B} = \mathcal{A}/\mathcal{I}\) is a quasi-coherent graded \(\mathcal{O}_X\)-algebra. The functoriality morphism \(\mathbb{P}' = \text{Proj}_{\mathcal{O}_X}(\mathcal{B}) \to \text{Proj}_{\mathcal{O}_X}(\mathcal{A})\) is everywhere defined and a closed immersion, see Lemma \[\text{12.3}\]. Hence it suffices to prove \(Z = Z'\) as closed subspaces of \(P\).

Having said this, the question is étale local on the base and we reduce to the case of schemes (Divisors, Lemma \[\text{31.1}\]) by étale localization. \(\square\)

In case the closed subspace is locally cut out by finitely many equations we can define it by a finite type ideal sheaf of \(\mathcal{A}\).

#### Lemma 16.2. Let \(S\) be a scheme. Let \(X\) be a quasi-compact and quasi-separated algebraic space over \(S\). Let \(\mathcal{A}\) be a quasi-coherent graded \(\mathcal{O}_X\)-algebra. Let \(\pi : P = \text{Proj}_{\mathcal{O}_X}(\mathcal{A}) \to X\) be the relative Proj of \(\mathcal{A}\). Let \(i : Z \to P\) be a closed subscheme. If \(\pi\) is quasi-compact and \(i\) of finite presentation, then there exists a \(d > 0\) and a quasi-coherent finite type \(\mathcal{O}_X\)-submodule \(\mathcal{F} \subset \mathcal{A}_d\) such that \(Z = \text{Proj}_X(\mathcal{A}/\mathcal{F})\).
**Proof.** The reader can redo the arguments used in the case of schemes. However, we will show the lemma follows from the case of schemes by a trick. Let $I \subset A$ be the quasi-coherent graded ideal cutting out $Z$ of Lemma 16.1. Choose an affine scheme $U$ and a surjective étale morphism $U \to X$, see Properties of Spaces, Lemma 6.3. By the case of schemes (Divisors, Lemma 31.5) there exists a $d > 0$ and a quasi-coherent finite type $O_U$-submodule $F' \subset I_d \subset A_d$ such that $Z \times_X U$ is equal to $\text{Proj}_U(A_U/F'A_U)$. By Limits of Spaces, Lemma 9.2 we can find a finite type quasi-coherent submodule $F \subset I_d$ such that $F' \subset F|_U$. Let $Z' = \text{Proj}_X(A/F)$. Then $Z' \to P$ is a closed immersion (Lemma 12.5) and $Z \subset Z'$ as $FA \subset I$. On the other hand, $Z' \times_X U \subset Z \times_X U$ by our choice of $F$. Thus $Z = Z'$ as desired. □

**Lemma 16.3.** Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $A$ be a quasi-coherent graded $O_X$-algebra. Let $\pi : P = \text{Proj}_X(A) \to X$ be the relative Proj of $A$. Let $i : Z \to X$ be a closed subspace. Let $U \subset X$ be an open. Assume that

1. $\pi$ is quasi-compact,
2. $i$ of finite presentation,
3. $U \cap |i||i([Z])| = \emptyset$,
4. $U$ is quasi-compact,
5. $A_n$ is a finite type $O_X$-module for all $n$.

Then there exists a $d > 0$ and a quasi-coherent finite type $O_X$-submodule $F \subset A_d$ with (a) $Z = \text{Proj}_X(A/FA)$ and (b) the support of $A_d/F$ is disjoint from $U$.

**Proof.** We use the same trick as in the proof of Lemma 16.2 to reduce to the case of schemes. Let $I \subset A$ be the quasi-coherent graded ideal cutting out $Z$ of Lemma 16.1. Choose an affine scheme $W$ and a surjective étale morphism $W \to X$, see Properties of Spaces, Lemma 6.3. By the case of schemes (Divisors, Lemma 31.5) there exists a $d > 0$ and a quasi-coherent finite type $O_W$-submodule $F' \subset I_d \subset A_d$ such that (a) $Z \times_X W$ is equal to $\text{Proj}_W(A_W/F'A_W)$ and (b) the support of $A_d/F'$ is disjoint from $U \times_X W$. By Limits of Spaces, Lemma 9.2, we can find a finite type quasi-coherent submodule $F \subset I_d$ such that $F' \subset F|_W$. Let $Z' = \text{Proj}_X(A/F)$. Then $Z' \to P$ is a closed immersion (Lemma 12.5) and $Z \subset Z'$ as $FA \subset I$. On the other hand, $Z' \times_X W \subset Z \times_X W$ by our choice of $F$. Thus $Z = Z'$. Finally, we see that $A_d/F$ is supported on $X \setminus U$ as $A_d/W/F|_W$ is a quotient of $A_d/W/F'$ which is supported on $W \setminus U \times X W$. Thus the lemma follows. □

**Lemma 16.4.** Let $S$ be a scheme and let $X$ be an algebraic space over $S$. Let $E$ be a quasi-coherent $O_X$-module. There is a bijection

$$\left\{ \begin{array}{c} \text{sections } \sigma \text{ of the } \text{morphism } P(E) \to X \\ \text{surjections } E \to L \text{ where } L \text{ is an invertible } O_X\text{-module} \end{array} \right\} \leftrightarrow$$

In this case $\sigma$ is a closed immersion and there is a canonical isomorphism

$$\text{Ker}(E \to L) \otimes_{O_X} L^{-1} \to C_{\sigma(X)/P(E)}$$

Both the bijection and isomorphism are compatible with base change.

**Proof.** Because the constructions are compatible with base change, it suffices to check the statement étale locally on $X$. Thus we may assume $X$ is a scheme and the result is Divisors, Lemma 31.6. □
17. Blowing up

Blowing up is an important tool in algebraic geometry.

Definition 17.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $I \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals, and let $Z \subset X$ be the closed subspace corresponding to $I$ (Morphisms of Spaces, Lemma 13.1). The blowing up of $X$ along $Z$, or the blowing up of $X$ in the ideal sheaf $I$ is the morphism

$$b : \text{Proj}_X \left( \bigoplus_{n \geq 0} T^n \right) \rightarrow X$$

The exceptional divisor of the blowup is the inverse image $b^{-1}(Z)$. Sometimes $Z$ is called the center of the blowup.

We will see later that the exceptional divisor is an effective Cartier divisor. Moreover, the blowing up is characterized as the “smallest” algebraic space over $X$ such that the inverse image of $Z$ is an effective Cartier divisor.

If $b : X' \rightarrow X$ is the blowup of $X$ in $Z$, then we often denote $\mathcal{O}_{X'}(n)$ the twists of the structure sheaf. Note that these are invertible $\mathcal{O}_{X'}$-modules and that $\mathcal{O}_{X'}(n) = \mathcal{O}_X(1)^{\otimes n}$ because $X'$ is the relative Proj of a quasi-coherent graded $\mathcal{O}_X$-algebra which is generated in degree 1, see Lemma 11.11.

Lemma 17.2. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $I \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let $U = \text{Spec}(A)$ be an affine scheme étale over $X$ and let $I \subset A$ be the ideal corresponding to $I|_U$. If $X' \rightarrow X$ is the blowup of $X$ in $I$, then there is a canonical isomorphism

$$U \times_X X' = \text{Proj}( \bigoplus_{n \geq 0} I^n )$$

of schemes over $U$, where the right hand side is the homogeneous spectrum of the Rees algebra of $I$ in $A$. Moreover, $U \times_X X'$ has an affine open covering by spectra of the affine blowup algebras $A[I^{1/n}]$.

Proof. Note that the restriction $I|_U$ is equal to the pullback of $I$ via the morphism $U \rightarrow X$, see Properties of Spaces, Section 26. Thus the lemma follows on combining Lemma 11.2 with Divisors, Lemma 32.2. □

Lemma 17.3. Let $S$ be a scheme. Let $X_1 \rightarrow X_2$ be a flat morphism of algebraic spaces over $S$. Let $Z_2 \subset X_2$ be a closed subspace. Let $Z_1$ be the inverse image of $Z_2$ in $X_1$. Let $X'_1$ be the blowup of $Z_1$ in $X_1$. Then there exists a cartesian diagram

$$\begin{array}{ccc}
X'_1 & \longrightarrow & X'_2 \\
\downarrow & & \downarrow \\
X_1 & \longrightarrow & X_2
\end{array}$$

of algebraic spaces over $S$.

Proof. Let $\mathcal{I}_2$ be the ideal sheaf of $Z_2$ in $X_2$. Denote $g : X_1 \rightarrow X_2$ the given morphism. Then the ideal sheaf $\mathcal{I}_1$ of $Z_1$ is the image of $g^*\mathcal{I}_2 \rightarrow \mathcal{O}_{X_1}$ (see Morphisms of Spaces, Definition 13.2 and discussion following the definition). By Lemma 11.5 we see that $X_1 \times_{X_2} X'_2$ is the relative Proj of $\bigoplus_{n \geq 0} g^*\mathcal{I}_2^n$. Because $g$ is flat the map $g^*\mathcal{I}_2^n \rightarrow \mathcal{O}_{X_1}$ is injective with image $\mathcal{I}_1^n$. Thus we see that $X_1 \times_{X_2} X'_2 = X'_1$. □
Lemma 17.4. Let \( S \) be a scheme. Let \( X \) be an algebraic space over \( S \). Let \( Z \subseteq X \) be a closed subspace. The blowing up \( b : X' \to X \) of \( X \) in \( Z \) has the following properties:

1. \( b|_{b^{-1}(X \setminus Z)} : b^{-1}(X \setminus Z) \to X \setminus Z \) is an isomorphism,
2. the exceptional divisor \( E = b^{-1}(Z) \) is an effective Cartier divisor on \( X' \),
3. there is a canonical isomorphism \( \mathcal{O}_X(-1) = \mathcal{O}_{X'}(E) \)

Proof. Let \( U \) be a scheme and let \( U \to X \) be a surjective étale morphism. As blowing up commutes with flat base change (Lemma 17.3) we can prove each of these statements after base change to \( U \). This reduces us to the case of schemes. In this case the result is Divisors, Lemma 32.4.

Lemma 17.5 (Universal property blowing up). Let \( S \) be a scheme. Let \( X \) be an algebraic space over \( S \). Let \( Z \subseteq X \) be a closed subspace. Let \( \mathcal{C} \) be the full subcategory of \( \text{Spaces}/X \) consisting of \( Y \to X \) such that the inverse image of \( Z \) is an effective Cartier divisor on \( Y \). Then the blowing up \( b : X' \to X \) of \( Z \) in \( X \) is a final object of \( \mathcal{C} \).

Proof. We see that \( b : X' \to X \) is an object of \( \mathcal{C} \) according to Lemma 17.4. Let \( f : Y \to X \) be an object of \( \mathcal{C} \). We have to show there exists a unique morphism \( Y \to X' \) over \( X \). Let \( D = f^{-1}(Z) \). Let \( \mathcal{I} \subseteq \mathcal{O}_X \) be the ideal sheaf of \( Z \) and let \( \mathcal{I}_D \) be the ideal sheaf of \( D \). Then \( f^* \mathcal{I} \to \mathcal{I}_D \) is a surjection to an invertible \( \mathcal{O}_Y \)-module. This extends to a map \( \psi : \bigoplus f^* \mathcal{I}^d \to \bigoplus \mathcal{I}_D^d \) of graded \( \mathcal{O}_Y \)-algebras. (We observe that \( \mathcal{I}_D^d = \mathcal{I}_D^{\text{red}} \) as \( D \) is an effective Cartier divisor.) By Lemma 11.1 the triple \((f : Y \to X, \mathcal{I}_D, \psi)\) defines a morphism \( Y \to X' \) over \( X \). The restriction

\[
Y \setminus D \to X' \setminus b^{-1}(Z) = X \setminus Z
\]

is unique. The open \( Y \setminus D \) is scheme theoretically dense in \( Y \) according to Lemma 6.4. Thus the morphism \( Y \to X' \) is unique by Morphisms of Spaces, Lemma 17.8 (also \( b \) is separated by Lemma 11.6).

Lemma 17.6. Let \( S \) be a scheme. Let \( X \) be an algebraic space over \( S \). Let \( Z \subseteq X \) be an effective Cartier divisor. The blowup of \( X \) in \( Z \) is the identity morphism of \( X \).

Proof. Immediate from the universal property of blowups (Lemma 17.5).

Lemma 17.7. Let \( S \) be a scheme. Let \( X \) be an algebraic space over \( S \). Let \( \mathcal{I} \subseteq \mathcal{O}_X \) be a quasi-coherent sheaf of ideals. If \( X \) is reduced, then the blowup \( X' \) of \( X \) in \( \mathcal{I} \) is reduced.

Proof. Let \( U \) be a scheme and let \( U \to X \) be a surjective étale morphism. As blowing up commutes with flat base change (Lemma 17.3) we can prove each of these statements after base change to \( U \). This reduces us to the case of schemes. In this case the result is Divisors, Lemma 32.8.

Lemma 17.8. Let \( S \) be a scheme. Let \( X \) be an algebraic space over \( S \). Let \( b : X' \to X \) be the blowup of \( X \) is a closed subspace. If \( X \) satisfies the equivalent conditions of Morphisms of Spaces, Lemma 49.1 then so does \( X' \).

Proof. Follows immediately from the lemma cited in the statement, the étale local description of blowing ups in Lemma 17.2 and Divisors, Lemma 32.10.
Lemma 17.9. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $b : X' \to X$ be a blowup of $X$ in a closed subspace. For any effective Cartier divisor $D$ on $X$ the pullback $b^{-1} D$ is defined (see Definition 6.10).

Proof. By Lemmas 17.2 and 6.2 this reduces to the following algebra fact: Let $A$ be a ring, $I \subset A$ an ideal, $a \in I$, and $x \in A$ a nonzerodivisor. Then the image of $x$ in $A[I]_a$ is a nonzerodivisor. Namely, suppose that $x(y/a^n) = 0$ in $A[I]_a$. Then $a^m xy = 0$ in $A$ for some $m$. Hence $a^m y = 0$ as $x$ is a nonzerodivisor. Whence $y/a^n$ is zero in $A[I]_a$ as desired. □

Lemma 17.10. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $I \subset \mathcal{O}_X$ and $\mathcal{J}$ be quasi-coherent sheaves of ideals. Let $b : X' \to X$ be the blowing up of $X$ in $I$. Let $b' : X'' \to X'$ be the blowing up of $X'$ in $b^{-1} \mathcal{J} \mathcal{O}_{X'}$. Then $X'' \to X$ is canonically isomorphic to the blowing up of $X$ in $I \mathcal{J}$.

Proof. Let $E \subset X'$ be the exceptional divisor of $b$ which is an effective Cartier divisor by Lemma 17.4 Then $(b')^{-1} E$ is an effective Cartier divisor on $X''$ by Lemma 17.9 Let $E' \subset X''$ be the exceptional divisor of $b'$ (also an effective Cartier divisor). Consider the effective Cartier divisor $E'' = E' + (b')^{-1} E$. By construction the ideal of $E''$ is $(b \circ b')^{-1} I (b \circ b')^{-1} \mathcal{J} \mathcal{O}_{X'}$. Hence according to Lemma 17.5 there is a canonical morphism from $X''$ to the blowup $c : Y \to X$ of $X$ in $I \mathcal{J}$. Conversely, as $I \mathcal{J}$ pulls back to an invertible ideal we see that $c^{-1} \mathcal{I} \mathcal{O}_Y$ defines an effective Cartier divisor, see Lemma 6.8 Thus a morphism $c' : Y \to X'$ over $X$ by Lemma 17.5 Then $(c')^{-1} b^{-1} \mathcal{J} \mathcal{O}_Y = c^{-1} \mathcal{I} \mathcal{O}_Y$ which also defines an effective Cartier divisor. Thus a morphism $c'' : Y \to X''$ over $X$. We omit the verification that this morphism is inverse to the morphism $X'' \to Y$ constructed earlier. □

Lemma 17.11. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $I \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let $b : X' \to X$ be the blowing up of $X$ in the ideal sheaf $I$. If $I$ is of finite type, then $b : X' \to X$ is a proper morphism.

Proof. Let $U$ be a scheme and let $U \to X$ be a surjective étale morphism. As blowing up commutes with flat base change (Lemma 17.3) we can prove each of these statements after base change to $U$ (see Morphisms of Spaces, Lemma 40.2). This reduces us to the case of schemes. In this case the morphism $b$ is projective by Divisors, Lemma 32.13 hence proper by Morphisms, Lemma 41.5. □

Lemma 17.12. Let $S$ be a scheme and let $X$ be an algebraic space over $S$. Assume $X$ is quasi-compact and quasi-separated. Let $Z \subset X$ be a closed subspace of finite presentation. Let $b : X' \to X$ be the blowing up with center $Z$. Let $Z' \subset X'$ be a closed subspace of finite presentation. Let $X'' \to X'$ be the blowing up with center $Z'$. There exists a closed subspace $Y \subset X$ of finite presentation, such that

1. $|Y| = |Z| \cup |b|(|Z'|)$, and
2. the composition $X'' \to X$ is isomorphic to the blowing up of $X$ in $Y$.

Proof. The condition that $Z \to X$ is of finite presentation means that $Z$ is cut out by a finite type quasi-coherent sheaf of ideals $I \subset \mathcal{O}_X$, see Morphisms of Spaces, Lemma 28.12 Write $A = \bigoplus_{n \geq 0} I^n$ so that $X' = \text{Proj}(A)$. Note that $X \setminus Z$ is a quasi-compact open subspace of $X$ by Limits of Spaces, Lemma 14.1. Since $b^{-1}(X \setminus Z) \to X \setminus Z$ is an isomorphism (Lemma 17.4) the same result shows that $b^{-1}(X \setminus Z) \setminus Z'$ is quasi-compact open subspace in $X'$. Hence $U = X \setminus (Z \cup b(Z'))$ is quasi-compact open subspace in $X$. By Lemma 16.3 there exist a $d > 0$ and a
finite type \( \mathcal{O}_X \)-submodule \( \mathcal{F} \subset \mathcal{I}^d \) such that \( Z' = \text{Proj}(\mathcal{A}/\mathcal{F}, \mathcal{A}) \) and such that the support of \( \mathcal{I}^d/\mathcal{F} \) is contained in \( X \setminus U \).

Since \( \mathcal{F} \subset \mathcal{I}^d \) is an \( \mathcal{O}_X \)-submodule we may think of \( \mathcal{F} \subset \mathcal{I}^d \subset \mathcal{O}_X \) as a finite type quasi-coherent sheaf of ideals on \( X \). Let’s denote this \( \mathcal{J} \subset \mathcal{O}_X \) to prevent confusion. Since \( \mathcal{I}^d/\mathcal{J} \) and \( \mathcal{O}/\mathcal{I}^d \) are supported on \( |X| \setminus |U| \) we see that \( |V(\mathcal{J})| \) is contained in \( |X| \setminus |U| \). Conversely, as \( \mathcal{J} \subset \mathcal{I}^d \) we see that \( |Z| \subset |V(\mathcal{J})| \). Over \( X \setminus Z \cong X' \setminus b^{-1}(Z) \) the sheaf of ideals \( \mathcal{J} \) cuts out \( Z' \) (see displayed formula below). Hence \( |V(\mathcal{J})| \) equals \( |Z| \cup |b((|Z'|)|) \). It follows that also \( |V(\mathcal{I}, \mathcal{J})| = |Z| \cup |b((|Z'|)|) \).

Moreover, \( \mathcal{I}, \mathcal{J} \) is an ideal of finite type as a product of two such. We claim that \( X'' \to X \) is isomorphic to the blowing up of \( X \) in \( \mathcal{I}, \mathcal{J} \) which finishes the proof of the lemma by setting \( Y = V(\mathcal{I}, \mathcal{J}) \).

First, recall that the blowup of \( X \) in \( \mathcal{I}, \mathcal{J} \) is the same as the blowup of \( X' \) in \( b^{-1}\mathcal{J}\mathcal{O}_{X'} \), see Lemma \([17.10]\) Hence it suffices to show that the blowup of \( X' \) in \( b^{-1}\mathcal{J}\mathcal{O}_{X'} \) agrees with the blowup of \( X' \) in \( Z' \). We will show that

\[
b^{-1}\mathcal{J}\mathcal{O}_{X'} = \mathcal{I}^d_{\mathcal{I}^d}
\]

as ideal sheaves on \( X'' \). This will prove what we want as \( \mathcal{I}^d_{\mathcal{I}^d} \) cuts out the effective Cartier divisor \( dE \) and we can use Lemmas \([17.6] \) and \([17.10] \).

To see the displayed equality of the ideals we may work locally. With notation \( A, I, a \in I \) as in Lemma \([17.2] \) we see that \( \mathcal{F} \) corresponds to an \( R \)-submodule \( M \subset I^d \) mapping isomorphically to an ideal \( J \subset R \). The condition \( Z' = \text{Proj}(A/J, A) \) means that \( Z' \cap \text{Spec}(A[\frac{1}{a}]) \) is cut out by the ideal generated by the elements \( m/a^d, m \in M \). Say the element \( m \in M \) corresponds to the function \( f \in J \). Then in the affine blowup algebra \( A' = A[\frac{1}{a}] \) we see that \( f = (a^d m)/a^d = a^d (m/a^d) \). Thus the equality holds.

### 18. Strict transform

**Definition 18.1.** With \( Z \subset B \) and \( f : X \to B \) as above.
Given a quasi-coherent \( \mathcal{O}_X \)-module \( F \) the strict transform of \( F \) with respect to the blowup of \( B \) in \( Z \) is the quotient \( F' \) of \( \text{pr}_X^* F \) by the submodule of sections supported on \( |\text{pr}_{B'}^{-1} E| \).

The strict transform of \( X \) is the closed subspace \( X' \subset X \times_B B' \) cut out by the quasi-coherent ideal of sections of \( \mathcal{O}_{X \times_B B'} \) supported on \( |\text{pr}_{B'}^{-1} E| \).

Note that taking the strict transform along a blowup depends on the closed subspace used for the blowup (and not just on the morphism \( B' \to B \)).

**Lemma 18.2** (Étale localization and strict transform). In the situation of Definition 18.1. Let

\[
\begin{array}{ccc}
U & \longrightarrow & X \\
\downarrow & & \downarrow \\
V & \longrightarrow & B
\end{array}
\]

be a commutative diagram of morphisms with \( U \) and \( V \) schemes and étale horizontal arrows. Let \( V' \to V \) be the blowup of \( V \) in \( Z \times_B V \). Then

1. \( V' = V \times_B B' \) and the maps \( V' \to B' \) and \( U \times_V V' \to X \times_B B' \) are étale,
2. the strict transform \( U' \) of \( U \) relative to \( V' \to V \) is equal to \( X' \times_X U \) where \( X' \) is the strict transform of \( X \) relative to \( B' \to B \), and
3. for a quasi-coherent \( \mathcal{O}_X \)-module \( F \) the restriction of the strict transform \( F' \) to \( U \times_V V' \) is the strict transform of \( F|_U \) relative to \( V' \to V \).

**Proof.** Part (1) follows from the fact that blowup commutes with flat base change (Lemma 17.3), the fact that étale morphisms are flat, and that the base change of an étale morphism is étale. Part (3) then follows from the fact that taking the sheaf of sections supported on a closed commutes with pullback by étale morphisms, see Limits of Spaces, Lemma 14.5. Part (2) follows from (3) applied to \( F = \mathcal{O}_X \). \( \square \)

**Lemma 18.3.** In the situation of Definition 18.1.

1. The strict transform \( X' \) of \( X \) is the blowup of \( X \) in the closed subspace \( f^{-1} Z \) of \( X \).
2. For a quasi-coherent \( \mathcal{O}_X \)-module \( F \) the strict transform \( F' \) is canonically isomorphic to the pushforward along \( X' \to X \times_B B' \) of the strict transform of \( F \) relative to the blowing up \( X' \to X \).

**Proof.** Let \( X'' \to X \) be the blowup of \( X \) in \( f^{-1} Z \). By the universal property of blowing up (Lemma 17.5) there exists a commutative diagram

\[
\begin{array}{ccc}
X'' & \longrightarrow & X \\
\downarrow & & \downarrow \\
B' & \longrightarrow & B
\end{array}
\]

whence a morphism \( i : X'' \to X \times_B B' \). The first assertion of the lemma is that \( i \) is a closed immersion with image \( X' \). The second assertion of the lemma is that \( F' = i_* F'' \) where \( F'' \) is the strict transform of \( F \) with respect to the blowing up \( X'' \to X \). We can check these assertions étale locally on \( X \), hence we reduce to the case of schemes (Divisors, Lemma 33.2). Some details omitted. \( \square \)

**Lemma 18.4.** In the situation of Definition 18.1.
(1) If $X$ is flat over $B$ at all points lying over $Z$, then the strict transform of $X$ is equal to the base change $X \times_B B'$.

(2) Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. If $\mathcal{F}$ is flat over $B$ at all points lying over $Z$, then the strict transform $\mathcal{F}'$ of $\mathcal{F}$ is equal to the pullback $\text{pr}_X^*\mathcal{F}$.

Proof. Omitted. Hint: Follows from the case of schemes (Divisors, Lemma 33.3) by étale localization (Lemma 18.2).

**Lemma 18.5.** Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $Z \subset B$ be a closed subspace. Let $b : B' \to B$ be the blowing up of $Z$ in $B$. Let $g : X \to Y$ be an affine morphism of spaces over $B$. Let $\mathcal{F}$ be a quasi-coherent sheaf on $X$. Let $g' : X \times_B B' \to Y \times_B B'$ be the base change of $g$. Let $\mathcal{F}'$ be the strict transform of $\mathcal{F}$ relative to $b$. Then $g'_\ast\mathcal{F}'$ is the strict transform of $g_\ast\mathcal{F}$.

Proof. Omitted. Hint: Follows from the case of schemes (Divisors, Lemma 33.4) by étale localization (Lemma 18.2).

**Lemma 18.6.** Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $Z \subset B$ be a closed subspace. Let $D \subset B$ be an effective Cartier divisor. Let $Z' \subset B$ be the closed subspace cut out by the product of the ideal sheaves of $Z$ and $D$. Let $B' \to B$ be the blowup of $B$ in $Z$.

(1) The blowup of $B$ in $Z'$ is isomorphic to $B' \to B$.

(2) Let $f : X \to B$ be a morphism of algebraic spaces and let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. If the subsheaf of $\mathcal{F}$ of sections supported on $|f^{-1}D|$ is zero, then the strict transform of $\mathcal{F}$ relative to the blowing up in $Z$ agrees with the strict transform of $\mathcal{F}$ relative to the blowing up of $B$ in $Z'$.

Proof. Omitted. Hint: Follows from the case of schemes (Divisors, Lemma 33.5) by étale localization (Lemma 18.2).

**Lemma 18.7.** Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $Z \subset B$ be a closed subspace. Let $b : B' \to B$ be the blowing up with center $Z$. Let $Z' \subset B'$ be a closed subspace. Let $B'' \to B'$ be the blowing up with center $Z'$. Let $Y \subset B$ be a closed subscheme such that $|Y| = |Z| \cup |b(|Z'|)$ and the composition $B'' \to B$ is isomorphic to the blowing up of $B$ in $Y$. In this situation, given any scheme $X$ over $B$ and $\mathcal{F} \in \text{QCoh}(\mathcal{O}_X)$ we have

(1) the strict transform of $\mathcal{F}$ with respect to the blowing up of $B$ in $Y$ is equal to the strict transform with respect to the blowup $B'' \to B'$ in $Z'$ of the strict transform of $\mathcal{F}$ with respect to the blowup $B' \to B$ of $B$ in $Z$, and

(2) the strict transform of $X$ with respect to the blowing up of $B$ in $Y$ is equal to the strict transform with respect to the blowup $B'' \to B'$ in $Z'$ of the strict transform of $X$ with respect to the blowup $B' \to B$ in $B$ in $Z$.

Proof. Omitted. Hint: Follows from the case of schemes (Divisors, Lemma 33.6) by étale localization (Lemma 18.2).

**Lemma 18.8.** In the situation of Definition 18.1. Suppose that

$$0 \to \mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3 \to 0$$

is an exact sequence of quasi-coherent sheaves on $X$ which remains exact after any base change $T \to B$. Then the strict transforms of $\mathcal{F}_i$ relative to any blowup $B' \to B$ form a short exact sequence $0 \to \mathcal{F}'_1 \to \mathcal{F}'_2 \to \mathcal{F}'_3 \to 0$ too.
Proof. Omitted. Hint: Follows from the case of schemes (Divisors, Lemma 33.7) by étale localization (Lemma 18.2).

\begin{lemma}
Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $F$ be a finite type quasi-coherent $\mathcal{O}_B$-module. Let $Z_k \subset S$ be the closed subscheme cut out by $\text{Fit}_k(F)$, see Section 5. Let $B' \to B$ be the blowup of $B$ in $Z_k$ and let $F'$ be the strict transform of $F$. Then $F'$ can locally be generated by $\leq k$ sections.

Proof. Omitted. Follows from the case of schemes (Divisors, Lemma 35.1) by étale localization (Lemma 18.2).
\end{lemma}

\begin{lemma}
Let $S$ be a scheme. Let $B$ be an algebraic space over $S$. Let $F$ be a finite type quasi-coherent $\mathcal{O}_B$-module. Let $Z_k \subset S$ be the closed subscheme cut out by $\text{Fit}_k(F)$, see Section 5. Assume that $F$ is locally free of rank $k$ on $B \setminus Z_k$. Let $B' \to B$ be the blowup of $B$ in $Z_k$ and let $F'$ be the strict transform of $F$. Then $F'$ is locally free of rank $k$.

Proof. Omitted. Follows from the case of schemes (Divisors, Lemma 35.2) by étale localization (Lemma 18.2).
\end{lemma}

19. Admissible blowups

To have a bit more control over our blowups we introduce the following standard terminology.

Definition 19.1. Let $S$ be a scheme. Let $X$ be an algebraic space over $S$. Let $U \subset X$ be an open subspace. A morphism $X' \to X$ is called a $U$-admissible blowup if there exists a closed immersion $Z \to X$ of finite presentation with $Z$ disjoint from $U$ such that $X'$ is isomorphic to the blowup of $X$ in $Z$.

We recall that $Z \to X$ is of finite presentation if and only if the ideal sheaf $\mathcal{I}_Z \subset \mathcal{O}_X$ is of finite type, see Morphisms of Spaces, Lemma 28.12. In particular, a $U$-admissible blowup is a proper morphism, see Lemma 17.11. Note that there can be multiple centers which give rise to the same morphism. Hence the requirement is just the existence of some center disjoint from $U$ which produces $X'$. Finally, as the morphism $b : X' \to X$ is an isomorphism over $U$ (see Lemma 17.4) we will often abuse notation and think of $U$ as an open subspace of $X'$ as well.

Lemma 19.2. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $U \subset X$ be a quasi-compact open subspace. Let $b : X' \to X$ be a $U \cap V$-admissible blowup. Let $X'' \to X$ be a $U$-admissible blowup. Then the composition $X'' \to X$ is a $U$-admissible blowup.

Proof. Immediate from the more precise Lemma 17.12.

Lemma 19.3. Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space. Let $U, V \subset X$ be quasi-compact open subspaces. Let $b : V' \to V$ be a $U \cap V$-admissible blowup. Then there exists a $U$-admissible blowup $X' \to X$ whose restriction to $V$ is $V'$.

Proof. Let $\mathcal{I} \subset \mathcal{O}_V$ be the finite type quasi-coherent sheaf of ideals such that $V(\mathcal{I})$ is disjoint from $U \cap V$ and such that $V'$ is isomorphic to the blowup of $V$ in $\mathcal{I}$. Let $\mathcal{I}' \subset \mathcal{O}_{U \setminus V}$ be the quasi-coherent sheaf of ideals whose restriction to $U$ is $\mathcal{O}_U$ and whose restriction to $V$ is $\mathcal{I}$. By Limits of Spaces, Lemma 9.8 there exists a finite...
type quasi-coherent sheaf of ideals $\mathcal{J} \subset \mathcal{O}_X$ whose restriction to $U \cup V$ is $\mathcal{T}'$. The lemma follows. □

**Lemma 19.4.** Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $U \subset X$ be a quasi-compact open subspace. Let $b_i : X_i \to X$, $i = 1, \ldots, n$ be $U$-admissible blowups. There exists a $U$-admissible blowup $b : X' \to X$ such that (a) $b$ factors as $X' \to X_i \to X$ for $i = 1, \ldots, n$ and (b) each of the morphisms $X' \to X_i$ is a $U$-admissible blowup.

**Proof.** Let $\mathcal{I}_i \subset \mathcal{O}_X$ be the finite type quasi-coherent sheaf of ideals such that $V(\mathcal{I}_i)$ is disjoint from $U$ and such that $X_i$ is isomorphic to the blowup of $X$ in $\mathcal{I}_i$. Set $\mathcal{I} = \mathcal{I}_1 \cdot \cdots \cdot \mathcal{I}_n$ and let $X'$ be the blowup of $X$ in $\mathcal{I}$. Then $X' \to X$ factors through $b_i$ by Lemma [17.10]

**Lemma 19.5.** Let $S$ be a scheme. Let $X$ be a quasi-compact and quasi-separated algebraic space over $S$. Let $U, V$ be quasi-compact disjoint open subspaces of $X$. Then there exist a $U \cup V$-admissible blowup $b : X' \to X$ such that $X'$ is a disjoint union of open subspaces $X' = X'_1 \amalg X'_2$ with $b^{-1}(U) \subset X'_1$ and $b^{-1}(V) \subset X'_2$.

**Proof.** Choose a finite type quasi-coherent sheaf of ideals $\mathcal{I}$, resp. $\mathcal{J}$ such that $X \setminus U = V(\mathcal{I})$, resp. $X \setminus V = V(\mathcal{J})$, see Limits of Spaces, Lemma [14.1]. Then $|V(\mathcal{I}, \mathcal{J})| = |X|$. Hence $\mathcal{I}, \mathcal{J}$ is a locally nilpotent sheaf of ideals. Since $\mathcal{I}$ and $\mathcal{J}$ are of finite type and $X$ is quasi-compact there exists an $n > 0$ such that $\mathcal{I}^n, \mathcal{J}^n = 0$. We may and do replace $\mathcal{I}$ by $\mathcal{I}^n$ and $\mathcal{J}$ by $\mathcal{J}^n$. Whence $\mathcal{I}, \mathcal{J} = 0$. Let $b : X' \to X$ be the blowing up in $\mathcal{I} + \mathcal{J}$. This is $U \cup V$-admissible as $|V(\mathcal{I}, \mathcal{J})| = |X| \setminus |U \cup V|$. We will show that $X'$ is a disjoint union of open subspaces $X' = X'_1 \amalg X'_2$ as in the statement of the lemma.

Since $|V(\mathcal{I} + \mathcal{J})|$ is the complement of $|U \cup V|$ we conclude that $V \cup U$ is scheme theoretically dense in $X'$, see Lemmas [17.4] and [6.4]. Thus if such a decomposition $X' = X'_1 \amalg X'_2$ into open and closed subspaces exists, then $X'_1$ is the scheme theoretic closure of $U$ in $X'$ and similarly $X'_2$ is the scheme theoretic closure of $V$ in $X'$. Since $U \to X'$ and $V \to X'$ are quasi-compact taking scheme theoretic closures commutes with étale localization (Morphisms of Spaces, Lemma [16.3]). Hence to verify the existence of $X'_1$ and $X'_2$ we may work étale locally on $X$. This reduces us to the case of schemes which is treated in the proof of Divisors, Lemma [34.5]. □
