1. Introduction

09VJ This chapter develops some theory concerning simplicial topological spaces, simplicial ringed spaces, simplicial schemes, and simplicial algebraic spaces. The theory of simplicial spaces sometimes allows one to prove local to global principles which appear difficult to prove in other ways. Some example applications can be found in the papers [Fal03], [Kie72], and [Del74].

We assume throughout that the reader is familiar with the basic concepts and results of the chapter Simplicial Methods, see Simplicial, Section 1. In particular, we continue to write X and not X_\bullet for a simplicial object.

2. Simplicial topological spaces

09VK A *simplicial space* is a simplicial object in the category of topological spaces where morphisms are continuous maps of topological spaces. (We will use “simplicial algebraic space” to refer to simplicial objects in the category of algebraic spaces.) We may picture a simplicial space X as follows

$$X_2 \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} X_1 \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} X_0$$

Here there are two morphisms $d_0^1, d_1^1 : X_1 \rightarrow X_0$ and a single morphism $s_0^0 : X_0 \rightarrow X_1$, etc. It is important to keep in mind that $d_i^n : X_n \rightarrow X_{n-1}$ should be thought of as a “projection forgetting the i th coordinate” and $s_j^n : X_n \rightarrow X_{n+1}$ as the diagonal map repeating the j th coordinate.

Let X be a simplicial space. We associate a site X_{Zar}^1 to X as follows.

- (1) An object of X_{Zar} is an open U of X_n for some n ,
- (2) a morphism $U \rightarrow V$ of X_{Zar} is given by a $\varphi : [m] \rightarrow [n]$ where n, m are such that $U \subset X_n$, $V \subset X_m$ and φ is such that $X(\varphi)(U) \subset V$, and
- (3) a covering $\{U_i \rightarrow U\}$ in X_{Zar} means that $U, U_i \subset X_n$ are open, the maps $U_i \rightarrow U$ are given by $\text{id} : [n] \rightarrow [n]$, and $U = \bigcup U_i$.

Note that in particular, if $U \rightarrow V$ is a morphism of X_{Zar} given by φ , then $X(\varphi) : X_n \rightarrow X_m$ does in fact induce a continuous map $U \rightarrow V$ of topological spaces.

It is clear that the above is a special case of a construction that associates to any diagram of topological spaces a site. We formulate the obligatory lemma.

09VL **Lemma 2.1.** *Let X be a simplicial space. Then X_{Zar} as defined above is a site.*

Proof. Omitted. □

Let X be a simplicial space. Let \mathcal{F} be a sheaf on X_{Zar} . It is clear from the definition of coverings, that the restriction of \mathcal{F} to the opens of X_n defines a sheaf \mathcal{F}_n on the topological space X_n . For every $\varphi : [m] \rightarrow [n]$ the restriction maps of \mathcal{F} for pairs $U \subset X_n$, $V \subset X_m$ with $X(\varphi)(U) \subset V$, define an $X(\varphi)$ -map $\mathcal{F}(\varphi) : \mathcal{F}_m \rightarrow \mathcal{F}_n$, see Sheaves, Definition 21.7. Moreover, given $\varphi : [m] \rightarrow [n]$ and $\psi : [l] \rightarrow [m]$ we have

$$\mathcal{F}(\varphi) \circ \mathcal{F}(\psi) = \mathcal{F}(\varphi \circ \psi)$$

¹This notation is similar to the notation in Sites, Example 6.4 and Topologies, Definition 3.7.

(LHS uses composition of f -maps, see Sheaves, Definition 21.9). Clearly, the converse is true as well: if we have a system $(\{\mathcal{F}_n\}_{n \geq 0}, \{\mathcal{F}(\varphi)\}_{\varphi \in \text{Arrows}(\Delta)})$ as above, satisfying the displayed equalities, then we obtain a sheaf on X_{Zar} .

09VM **Lemma 2.2.** *Let X be a simplicial space. There is an equivalence of categories between*

- (1) $Sh(X_{Zar})$, and
- (2) category of systems $(\mathcal{F}_n, \mathcal{F}(\varphi))$ described above.

Proof. See discussion above. \square

09VN **Lemma 2.3.** *Let $f : Y \rightarrow X$ be a morphism of simplicial spaces. Then the functor $u : X_{Zar} \rightarrow Y_{Zar}$ which associates to the open $U \subset X_n$ the open $f_n^{-1}(U) \subset Y_n$ defines a morphism of sites $f_{Zar} : Y_{Zar} \rightarrow X_{Zar}$.*

Proof. It is clear that u is a continuous functor. Hence we obtain functors $f_{Zar,*} = u^s$ and $f_{Zar}^{-1} = u_s$, see Sites, Section 14. To see that we obtain a morphism of sites we have to show that u_s is exact. We will use Sites, Lemma 14.5 to see this. Let $V \subset Y_n$ be an open subset. The category \mathcal{I}_V^u (see Sites, Section 5) consists of pairs (U, φ) where $\varphi : [m] \rightarrow [n]$ and $U \subset X_m$ open such that $Y(\varphi)(V) \subset f_m^{-1}(U)$. Moreover, a morphism $(U, \varphi) \rightarrow (U', \varphi')$ is given by a $\psi : [m'] \rightarrow [m]$ such that $X(\psi)(U) \subset U'$ and $\varphi \circ \psi = \varphi'$. It is our task to show that \mathcal{I}_V^u is cofiltered.

We verify the conditions of Categories, Definition 20.1. Condition (1) holds because $(X_n, \text{id}_{[n]})$ is an object. Let (U, φ) be an object. The condition $Y(\varphi)(V) \subset f_m^{-1}(U)$ is equivalent to $V \subset f_n^{-1}(X(\varphi)^{-1}(U))$. Hence we obtain a morphism $(X(\varphi)^{-1}(U), \text{id}_{[n]}) \rightarrow (U, \varphi)$ given by setting $\psi = \varphi$. Moreover, given a pair of objects of the form $(U, \text{id}_{[n]})$ and $(U', \text{id}_{[n]})$ we see there exists an object, namely $(U \cap U', \text{id}_{[n]})$, which maps to both of them. Thus condition (2) holds. To verify condition (3) suppose given two morphisms $a, a' : (U, \varphi) \rightarrow (U', \varphi')$ given by $\psi, \psi' : [m'] \rightarrow [m]$. Then precomposing with the morphism $(X(\varphi)^{-1}(U), \text{id}_{[n]}) \rightarrow (U, \varphi)$ given by φ equalizes a, a' because $\varphi \circ \psi = \varphi' = \varphi \circ \psi'$. This finishes the proof. \square

09VP **Lemma 2.4.** *Let $f : Y \rightarrow X$ be a morphism of simplicial spaces. In terms of the description of sheaves in Lemma 2.2 the morphism f_{Zar} of Lemma 2.3 can be described as follows.*

- (1) If \mathcal{G} is a sheaf on Y , then $(f_{Zar,*}\mathcal{G})_n = f_{n,*}\mathcal{G}_n$.
- (2) If \mathcal{F} is a sheaf on X , then $(f_{Zar}^{-1}\mathcal{F})_n = f_n^{-1}\mathcal{F}_n$.

Proof. The first part is immediate from the definitions. For the second part, note that in the proof of Lemma 2.3 we have shown that for a $V \subset Y_n$ open the category $(\mathcal{I}_V^u)^{opp}$ contains as a cofinal subcategory the category of opens $U \subset X_n$ with $f_n^{-1}(U) \supset V$ and morphisms given by inclusions. Hence we see that the restriction of $u_p\mathcal{F}$ to opens of Y_n is the presheaf $f_{n,p}\mathcal{F}_n$ as defined in Sheaves, Lemma 21.3. Since $f_{Zar}^{-1}\mathcal{F} = u_s\mathcal{F}$ is the sheafification of $u_p\mathcal{F}$ and since sheafification uses only coverings and since coverings in Y_{Zar} use only inclusions between opens on the same Y_n , the result follows from the fact that $f_n^{-1}\mathcal{F}_n$ is (correspondingly) the sheafification of $f_{n,p}\mathcal{F}_n$, see Sheaves, Section 21. \square

Let X be a topological space. In Sites, Example 6.4 we denoted X_{Zar} the site consisting of opens of X with inclusions as morphisms and coverings given by open coverings. We identify the topos $Sh(X_{Zar})$ with the category of sheaves on X .

09W0 **Lemma 2.5.** *Let X be a simplicial space. The functor $X_{n,Zar} \rightarrow X_{Zar}$, $U \mapsto U$ is continuous and cocontinuous. The associated morphism of topoi $g_n : Sh(X_n) \rightarrow Sh(X_{Zar})$ satisfies*

- (1) g_n^{-1} associates to the sheaf \mathcal{F} on X the sheaf \mathcal{F}_n on X_n ,
- (2) $g_n^{-1} : Sh(X_{Zar}) \rightarrow Sh(X_n)$ has a left adjoint g_n^{Sh} ,
- (3) g_n^{Sh} commutes with finite connected limits,
- (4) $g_n^{-1} : Ab(X_{Zar}) \rightarrow Ab(X_n)$ has a left adjoint $g_n!$, and
- (5) $g_n!$ is exact.

Proof. Besides the properties of our functor mentioned in the statement, the category $X_{n,Zar}$ has fibre products and equalizers and the functor commutes with them (beware that X_{Zar} does not have all fibre products). Hence the lemma follows from the discussion in Sites, Sections 19 and 20 and Modules on Sites, Section 16. More precisely, Sites, Lemmas 20.1, 20.5, and 20.6 and Modules on Sites, Lemmas 16.2 and 16.3. \square

09W1 **Lemma 2.6.** *Let X be a simplicial space. If \mathcal{I} is an injective abelian sheaf on X_{Zar} , then \mathcal{I}_n is an injective abelian sheaf on X_n .*

Proof. This follows from Homology, Lemma 26.1 and Lemma 2.5. \square

09W2 **Lemma 2.7.** *Let $f : Y \rightarrow X$ be a morphism of simplicial spaces. Then*

$$\begin{array}{ccc} Sh(Y_n) & \xrightarrow{f_n} & Sh(X_n) \\ \downarrow & & \downarrow \\ Sh(Y_{Zar}) & \xrightarrow{f_{Zar}} & Sh(X_{Zar}) \end{array}$$

is a commutative diagram of topoi.

Proof. Direct from the description of pullback functors in Lemmas 2.4 and 2.5. \square

09W4 **Lemma 2.8.** *Let Y be a simplicial space and let $a : Y \rightarrow X$ be an augmentation (Simplicial, Definition 20.1). Let $a_n : Y_n \rightarrow X$ be the corresponding morphisms of topological spaces. There is a canonical morphism of topoi*

$$a : Sh(Y_{Zar}) \rightarrow Sh(X)$$

with the following properties:

- (1) $a^{-1}\mathcal{F}$ is the sheaf restricting to $a_n^{-1}\mathcal{F}$ on Y_n ,
- (2) $a_m \circ Y(\varphi) = a_n$ for all $\varphi : [m] \rightarrow [n]$,
- (3) $a \circ g_n = a_n$ as morphisms of topoi with g_n as in Lemma 2.5,
- (4) $a_*\mathcal{G}$ for $\mathcal{G} \in Sh(Y_{Zar})$ is the equalizer of the two maps $a_{0,*}\mathcal{G}_0 \rightarrow a_{1,*}\mathcal{G}_1$.

Proof. Part (2) holds for augmentations of simplicial objects in any category. Thus $Y(\varphi)^{-1}a_m^{-1}\mathcal{F} = a_n^{-1}\mathcal{F}$ which defines an $Y(\varphi)$ -map from $a_m^{-1}\mathcal{F}$ to $a_n^{-1}\mathcal{F}$. Thus we can use (1) as the definition of $a^{-1}\mathcal{F}$ (using Lemma 2.2) and (4) as the definition of a_* . If this defines a morphism of topoi then part (3) follows because we'll have $g_n^{-1} \circ a^{-1} = a_n^{-1}$ by construction. To check a is a morphism of topoi we have to show that a^{-1} is left adjoint to a_* and we have to show that a^{-1} is exact. The last fact is immediate from the exactness of the functors a_n^{-1} .

Let \mathcal{F} be an object of $Sh(X)$ and let \mathcal{G} be an object of $Sh(Y_{Zar})$. Given $\beta : a^{-1}\mathcal{F} \rightarrow \mathcal{G}$ we can look at the components $\beta_n : a_n^{-1}\mathcal{F} \rightarrow \mathcal{G}_n$. These maps are adjoint to maps

$\beta_n : \mathcal{F} \rightarrow a_{n,*}\mathcal{G}_n$. Compatibility with the simplicial structure shows that β_0 maps into $a_*\mathcal{G}$. Conversely, suppose given a map $\alpha : \mathcal{F} \rightarrow a_*\mathcal{G}$. For any n choose a $\varphi : [0] \rightarrow [n]$. Then we can look at the composition

$$\mathcal{F} \xrightarrow{\alpha} a_*\mathcal{G} \rightarrow a_{0,*}\mathcal{G}_0 \xrightarrow{\mathcal{G}(\varphi)} a_{n,*}\mathcal{G}_n$$

These are adjoint to maps $a_n^{-1}\mathcal{F} \rightarrow \mathcal{G}_n$ which define a morphism of sheaves $a^{-1}\mathcal{F} \rightarrow \mathcal{G}$. We omit the proof that the constructions given above define mutually inverse bijections

$$\text{Mor}_{\text{Sh}(Y_{Zar})}(a^{-1}\mathcal{F}, \mathcal{G}) = \text{Mor}_{\text{Sh}(X)}(\mathcal{F}, a_*\mathcal{G})$$

This finishes the proof. An interesting observation is here that this morphism of topoi does not correspond to any obvious geometric functor between the sites defining the topoi. \square

09W5 **Lemma 2.9.** *Let X be a simplicial topological space. The complex of abelian presheaves on X_{Zar}*

$$\dots \rightarrow \mathbf{Z}_{X_2} \rightarrow \mathbf{Z}_{X_1} \rightarrow \mathbf{Z}_{X_0}$$

with boundary $\sum(-1)^i d_i^n$ is a resolution of the constant presheaf \mathbf{Z} .

Proof. Let $U \subset X_m$ be an object of X_{Zar} . Then the value of the complex above on U is the complex of abelian groups

$$\dots \rightarrow \mathbf{Z}[\text{Mor}_{\Delta}([2], [m])] \rightarrow \mathbf{Z}[\text{Mor}_{\Delta}([1], [m])] \rightarrow \mathbf{Z}[\text{Mor}_{\Delta}([0], [m])]$$

In other words, this is the complex associated to the free abelian group on the simplicial set $\Delta[m]$, see *Simplicial*, Example 11.2. Since $\Delta[m]$ is homotopy equivalent to $\Delta[0]$, see *Simplicial*, Example 26.7, and since “taking free abelian groups” is a functor, we see that the complex above is homotopy equivalent to the free abelian group on $\Delta[0]$ (*Simplicial*, Remark 26.4 and Lemma 27.2). This complex is acyclic in positive degrees and equal to \mathbf{Z} in degree 0. \square

09W6 **Lemma 2.10.** *Let X be a simplicial topological space. Let \mathcal{F} be an abelian sheaf on X . There is a spectral sequence $(E_r, d_r)_{r \geq 0}$ with*

$$E_1^{p,q} = H^q(X_p, \mathcal{F}_p)$$

converging to $H^{p+q}(X_{Zar}, \mathcal{F})$. This spectral sequence is functorial in \mathcal{F} .

Proof. Let $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ be an injective resolution. Consider the double complex with terms

$$A^{p,q} = \mathcal{I}^q(X_p)$$

and first differential given by the alternating sum along the maps d_i^{p+1} -maps $\mathcal{I}_p^q \rightarrow \mathcal{I}_{p+1}^q$, see Lemma 2.2. Note that

$$A^{p,q} = \Gamma(X_p, \mathcal{I}_p^q) = \text{Mor}_{\text{PSh}}(h_{X_p}, \mathcal{I}^q) = \text{Mor}_{\text{PAb}}(\mathbf{Z}_{X_p}, \mathcal{I}^q)$$

Hence it follows from Lemma 2.9 and *Cohomology on Sites*, Lemma 11.1 that the rows of the double complex are exact in positive degrees and evaluate to $\Gamma(X_{Zar}, \mathcal{I}^q)$ in degree 0. On the other hand, since restriction is exact (Lemma 2.5) the map

$$\mathcal{F}_p \rightarrow \mathcal{I}_p^\bullet$$

is a resolution. The sheaves \mathcal{I}_p^q are injective abelian sheaves on X_p (Lemma 2.6). Hence the cohomology of the columns computes the groups $H^q(X_p, \mathcal{F}_p)$. We conclude by applying *Homology*, Lemmas 22.6 and 22.7. \square

0D84 **Lemma 2.11.** *Let X be a simplicial space and let $a : X \rightarrow Y$ be an augmentation. Let \mathcal{F} be an abelian sheaf on X_{Zar} . Then $R^n a_* \mathcal{F}$ is the sheaf associated to the presheaf*

$$V \mapsto H^n((X \times_Y V)_{Zar}, \mathcal{F}|_{(X \times_Y V)_{Zar}})$$

Proof. This is the analogue of Cohomology, Lemma 8.3 or of Cohomology on Sites, Lemma 8.4 and we strongly encourage the reader to skip the proof. Choosing an injective resolution of \mathcal{F} on X_{Zar} and using the definitions we see that it suffices to show: (1) the restriction of an injective abelian sheaf on X_{Zar} to $(X \times_Y V)_{Zar}$ is an injective abelian sheaf and (2) $a_* \mathcal{F}$ is equal to the rule

$$V \mapsto H^0((X \times_Y V)_{Zar}, \mathcal{F}|_{(X \times_Y V)_{Zar}})$$

Part (2) follows from the following facts

- (2a) $a_* \mathcal{F}$ is the equalizer of the two maps $a_{0,*} \mathcal{F}_0 \rightarrow a_{1,*} \mathcal{F}_1$ by Lemma 2.8,
- (2b) $a_{0,*} \mathcal{F}_0(V) = H^0(a_0^{-1}(V), \mathcal{F}_0)$ and $a_{1,*} \mathcal{F}_1(V) = H^0(a_1^{-1}(V), \mathcal{F}_1)$,
- (2c) $X_0 \times_Y V = a_0^{-1}(V)$ and $X_1 \times_Y V = a_1^{-1}(V)$,
- (2d) $H^0((X \times_Y V)_{Zar}, \mathcal{F}|_{(X \times_Y V)_{Zar}})$ is the equalizer of the two maps $H^0(X_0 \times_Y V, \mathcal{F}_0) \rightarrow H^0(X_1 \times_Y V, \mathcal{F}_1)$ for example by Lemma 2.10.

Part (1) follows after one defines an exact left adjoint $j_! : Ab((X \times_Y V)_{Zar}) \rightarrow Ab(X_{Zar})$ (extension by zero) to restriction $Ab(X_{Zar}) \rightarrow Ab((X \times_Y V)_{Zar})$ and using Homology, Lemma 26.1. \square

Let X be a topological space. Denote X_\bullet the constant simplicial topological space with value X . By Lemma 2.2 a sheaf on $X_{\bullet,Zar}$ is the same thing as a cosimplicial object in the category of sheaves on X .

09W3 **Lemma 2.12.** *Let X be a topological space. Let X_\bullet be the constant simplicial topological space with value X . The functor*

$$X_{\bullet,Zar} \longrightarrow X_{Zar}, \quad U \mapsto U$$

is continuous and cocontinuous and defines a morphism of topoi $g : Sh(X_{\bullet,Zar}) \rightarrow Sh(X)$ as well as a left adjoint $g_!$ to g^{-1} . We have

- (1) g^{-1} associates to a sheaf on X the constant cosimplicial sheaf on X ,
- (2) $g_!$ associates to a sheaf \mathcal{F} on $X_{\bullet,Zar}$ the sheaf \mathcal{F}_0 , and
- (3) g_* associates to a sheaf \mathcal{F} on $X_{\bullet,Zar}$ the equalizer of the two maps $\mathcal{F}_0 \rightarrow \mathcal{F}_1$.

Proof. The statements about the functor are straightforward to verify. The existence of g and $g_!$ follow from Sites, Lemmas 20.1 and 20.5. The description of g^{-1} is immediate from Sites, Lemma 20.5. The description of g_* and $g_!$ follows as the functors given are right and left adjoint to g^{-1} . \square

3. Simplicial sites and topoi

09WB It seems natural to define a *simplicial site* as a simplicial object in the (big) category whose objects are sites and whose morphisms are morphisms of sites. See Sites, Definitions 6.2 and 14.1 with composition of morphisms as in Sites, Lemma 14.3. But here are some variants one might want to consider: (a) we could work with cocontinuous functors (see Sites, Sections 19 and 20) between sites instead, (b) we could work in a suitable 2-category of sites where one introduces the notion of a 2-morphism between morphisms of sites, (c) we could work in a 2-category

constructed out of cocontinuous functors. Instead of picking one of these variants as a definition we will simply develop theory as needed.

Certainly a *simplicial topos* should probably be defined as a pseudo-functor from Δ^{opp} into the 2-category of topoi. See Categories, Definition 28.5 and Sites, Section 15 and 35. We will try to avoid working with such a beast if possible.

Case A. Let \mathcal{C} be a simplicial object in the category whose objects are sites and whose morphisms are morphisms of sites. This means that for every morphism $\varphi : [m] \rightarrow [n]$ of Δ we have a morphism of sites $f_\varphi : \mathcal{C}_n \rightarrow \mathcal{C}_m$. This morphism is given by a continuous functor in the opposite direction which we will denote $u_\varphi : \mathcal{C}_m \rightarrow \mathcal{C}_n$.

09WC **Lemma 3.1.** *Let \mathcal{C} be a simplicial object in the category of sites. With notation as above we construct a site \mathcal{C}_{total} as follows.*

- (1) *An object of \mathcal{C}_{total} is an object U of \mathcal{C}_n for some n ,*
- (2) *a morphism $(\varphi, f) : U \rightarrow V$ of \mathcal{C}_{total} is given by a map $\varphi : [m] \rightarrow [n]$ with $U \in \text{Ob}(\mathcal{C}_n)$, $V \in \text{Ob}(\mathcal{C}_m)$ and a morphism $f : U \rightarrow u_\varphi(V)$ of \mathcal{C}_n , and*
- (3) *a covering $\{(id, f_i) : U_i \rightarrow U\}$ in \mathcal{C}_{total} is given by an n and a covering $\{f_i : U_i \rightarrow U\}$ of \mathcal{C}_n .*

Proof. Composition of $(\varphi, f) : U \rightarrow V$ with $(\psi, g) : V \rightarrow W$ is given by $(\varphi \circ \psi, u_\varphi(g) \circ f)$. This uses that $u_\varphi \circ u_\psi = u_{\varphi \circ \psi}$.

Let $\{(id, f_i) : U_i \rightarrow U\}$ be a covering as in (3) and let $(\varphi, g) : W \rightarrow U$ be a morphism with $W \in \text{Ob}(\mathcal{C}_m)$. We claim that

$$W \times_{(\varphi, g), U, (id, f_i)} U_i = W \times_{g, u_\varphi(U), u_\varphi(f_i)} u_\varphi(U_i)$$

in the category \mathcal{C}_{total} . This makes sense as by our definition of morphisms of sites, the required fibre products in \mathcal{C}_m exist since u_φ transforms coverings into coverings. The same reasoning implies the claim (details omitted). Thus we see that the collection of coverings is stable under base change. The other axioms of a site are immediate. \square

Case B. Let \mathcal{C} be a simplicial object in the category whose objects are sites and whose morphisms are cocontinuous functors. This means that for every morphism $\varphi : [m] \rightarrow [n]$ of Δ we have a cocontinuous functor denoted $u_\varphi : \mathcal{C}_n \rightarrow \mathcal{C}_m$. The associated morphism of topoi is denoted $f_\varphi : Sh(\mathcal{C}_n) \rightarrow Sh(\mathcal{C}_m)$.

09WD **Lemma 3.2.** *Let \mathcal{C} be a simplicial object in the category whose objects are sites and whose morphisms are cocontinuous functors. With notation as above, assume the functors $u_\varphi : \mathcal{C}_n \rightarrow \mathcal{C}_m$ have property P of Sites, Remark 19.5. Then we can construct a site \mathcal{C}_{total} as follows.*

- (1) *An object of \mathcal{C}_{total} is an object U of \mathcal{C}_n for some n ,*
- (2) *a morphism $(\varphi, f) : U \rightarrow V$ of \mathcal{C}_{total} is given by a map $\varphi : [m] \rightarrow [n]$ with $U \in \text{Ob}(\mathcal{C}_n)$, $V \in \text{Ob}(\mathcal{C}_m)$ and a morphism $f : u_\varphi(U) \rightarrow V$ of \mathcal{C}_m , and*
- (3) *a covering $\{(id, f_i) : U_i \rightarrow U\}$ in \mathcal{C}_{total} is given by an n and a covering $\{f_i : U_i \rightarrow U\}$ of \mathcal{C}_n .*

Proof. Composition of $(\varphi, f) : U \rightarrow V$ with $(\psi, g) : V \rightarrow W$ is given by $(\varphi \circ \psi, g \circ u_\psi(f))$. This uses that $u_\psi \circ u_\varphi = u_{\varphi \circ \psi}$.

Let $\{(id, f_i) : U_i \rightarrow U\}$ be a covering as in (3) and let $(\varphi, g) : W \rightarrow U$ be a morphism with $W \in \text{Ob}(\mathcal{C}_m)$. We claim that

$$W \times_{(\varphi, g), U, (id, f_i)} U_i = W \times_{g, U, f_i} U_i$$

in the category \mathcal{C}_{total} where the right hand side is the object of \mathcal{C}_m defined in Sites, Remark 19.5 which exists by property P . Compatibility of this type of fibre product with compositions of functors implies the claim (details omitted). Since the family $\{W \times_{g, U, f_i} U_i \rightarrow W\}$ is a covering of \mathcal{C}_m by property P we see that the collection of coverings is stable under base change. The other axioms of a site are immediate. \square

09WE **Situation 3.3.** Here we have one of the following two cases:

- (A) \mathcal{C} is a simplicial object in the category whose objects are sites and whose morphisms are morphisms of sites. For every morphism $\varphi : [m] \rightarrow [n]$ of Δ we have a morphism of sites $f_\varphi : \mathcal{C}_n \rightarrow \mathcal{C}_m$ given by a continuous functor $u_\varphi : \mathcal{C}_m \rightarrow \mathcal{C}_n$.
- (B) \mathcal{C} is a simplicial object in the category whose objects are sites and whose morphisms are cocontinuous functors having property P of Sites, Remark 19.5. For every morphism $\varphi : [m] \rightarrow [n]$ of Δ we have a cocontinuous functor $u_\varphi : \mathcal{C}_n \rightarrow \mathcal{C}_m$ which induces a morphism of topoi $f_\varphi : Sh(\mathcal{C}_n) \rightarrow Sh(\mathcal{C}_m)$.

As usual we will denote f_φ^{-1} and $f_{\varphi,*}$ the pullback and pushforward. We let \mathcal{C}_{total} denote the site defined in Lemma 3.1 (case A) or Lemma 3.2 (case B).

Let \mathcal{C} be as in Situation 3.3. Let \mathcal{F} be a sheaf on \mathcal{C}_{total} . It is clear from the definition of coverings, that the restriction of \mathcal{F} to the objects of \mathcal{C}_n defines a sheaf \mathcal{F}_n on the site \mathcal{C}_n . For every $\varphi : [m] \rightarrow [n]$ the restriction maps of \mathcal{F} along the morphisms $(\varphi, f) : U \rightarrow V$ with $U \in \text{Ob}(\mathcal{C}_n)$ and $V \in \text{Ob}(\mathcal{C}_m)$ define an element $\mathcal{F}(\varphi)$ of

$$\text{Mor}_{Sh(\mathcal{C}_m)}(\mathcal{F}_m, f_{\varphi,*}\mathcal{F}_n) = \text{Mor}_{Sh(\mathcal{C}_n)}(f_\varphi^{-1}\mathcal{F}_m, \mathcal{F}_n)$$

Moreover, given $\varphi : [m] \rightarrow [n]$ and $\psi : [l] \rightarrow [m]$ the diagrams

$$\begin{array}{ccc} \mathcal{F}_l & \xrightarrow{\mathcal{F}(\varphi \circ \psi)} & f_{\varphi \circ \psi,*}\mathcal{F}_n \\ \mathcal{F}(\psi) \searrow & & \nearrow f_{\psi,*}\mathcal{F}(\varphi) \\ & f_{\psi,*}\mathcal{F}_m & \end{array} \quad \text{and} \quad \begin{array}{ccc} f_{\varphi \circ \psi}^{-1}\mathcal{F}_l & \xrightarrow{\mathcal{F}(\varphi \circ \psi)} & \mathcal{F}_n \\ f_\varphi^{-1}\mathcal{F}(\psi) \searrow & & \nearrow \mathcal{F}(\varphi) \\ & f_\varphi^{-1}\mathcal{F}_m & \end{array}$$

commute. Clearly, the converse statement is true as well: if we have a system $(\{\mathcal{F}_n\}_{n \geq 0}, \{\mathcal{F}(\varphi)\}_{\varphi \in \text{Arrows}(\Delta)})$ satisfying the commutativity constraints above, then we obtain a sheaf on \mathcal{C}_{total} .

09WF **Lemma 3.4.** *In Situation 3.3 there is an equivalence of categories between*

- (1) $Sh(\mathcal{C}_{total})$, and
- (2) the category of systems $(\mathcal{F}_n, \mathcal{F}(\varphi))$ described above.

In particular, the topos $Sh(\mathcal{C}_{total})$ only depends on the topoi $Sh(\mathcal{C}_n)$ and the morphisms of topoi f_φ .

Proof. See discussion above. \square

09WG **Lemma 3.5.** *In Situation 3.3 the functor $\mathcal{C}_n \rightarrow \mathcal{C}_{total}$, $U \mapsto U$ is continuous and cocontinuous. The associated morphism of topoi $g_n : Sh(\mathcal{C}_n) \rightarrow Sh(\mathcal{C}_{total})$ satisfies*

- (1) g_n^{-1} associates to the sheaf \mathcal{F} on \mathcal{C}_{total} the sheaf \mathcal{F}_n on \mathcal{C}_n ,

- (2) $g_n^{-1} : Sh(\mathcal{C}_{total}) \rightarrow Sh(\mathcal{C}_n)$ has a left adjoint g_n^{Sh} ,
- (3) for \mathcal{G} in $Sh(\mathcal{C}_n)$ the restriction of $g_n^{Sh}\mathcal{G}$ to \mathcal{C}_m is $\prod_{\varphi:[n]\rightarrow[m]} f_\varphi^{-1}\mathcal{G}$,
- (4) g_n^{Sh} commutes with finite connected limits,
- (5) $g_n^{-1} : Ab(\mathcal{C}_{total}) \rightarrow Ab(\mathcal{C}_n)$ has a left adjoint $g_n!$,
- (6) for \mathcal{G} in $Ab(\mathcal{C}_n)$ the restriction of $g_n!\mathcal{G}$ to \mathcal{C}_m is $\bigoplus_{\varphi:[n]\rightarrow[m]} f_\varphi^{-1}\mathcal{G}$, and
- (7) $g_n!$ is exact.

Proof. Case A. If $\{U_i \rightarrow U\}_{i \in I}$ is a covering in \mathcal{C}_n then the image $\{U_i \rightarrow U\}_{i \in I}$ is a covering in \mathcal{C}_{total} by definition (Lemma 3.1). For a morphism $V \rightarrow U$ of \mathcal{C}_n , the fibre product $V \times_U U_i$ in \mathcal{C}_n is also the fibre product in \mathcal{C}_{total} (by the claim in the proof of Lemma 3.1). Therefore our functor is continuous. On the other hand, our functor defines a bijection between coverings of U in \mathcal{C}_n and coverings of U in \mathcal{C}_{total} . Therefore it is certainly the case that our functor is cocontinuous.

Case B. If $\{U_i \rightarrow U\}_{i \in I}$ is a covering in \mathcal{C}_n then the image $\{U_i \rightarrow U\}_{i \in I}$ is a covering in \mathcal{C}_{total} by definition (Lemma 3.2). For a morphism $V \rightarrow U$ of \mathcal{C}_n , the fibre product $V \times_U U_i$ in \mathcal{C}_n is also the fibre product in \mathcal{C}_{total} (by the claim in the proof of Lemma 3.2). Therefore our functor is continuous. On the other hand, our functor defines a bijection between coverings of U in \mathcal{C}_n and coverings of U in \mathcal{C}_{total} . Therefore it is certainly the case that our functor is cocontinuous.

At this point part (1) and the existence of g_n^{Sh} and $g_n!$ in cases A and B follows from Sites, Lemmas 20.1 and 20.5 and Modules on Sites, Lemmas 16.2 and 16.4.

Proof of (3). Let \mathcal{G} be a sheaf on \mathcal{C}_n . Consider the sheaf \mathcal{H} on \mathcal{C}_{total} whose degree m part is the sheaf

$$\mathcal{H}_m = \prod_{\varphi:[n]\rightarrow[m]} f_\varphi^{-1}\mathcal{G}$$

given in part (3) of the statement of the lemma. Given a map $\psi : [m] \rightarrow [m']$ the map $\mathcal{H}(\psi) : f_\psi^{-1}\mathcal{H}_m \rightarrow \mathcal{H}_{m'}$ is given on components by the identifications

$$f_\psi^{-1}f_\varphi^{-1}\mathcal{G} \rightarrow f_{\psi \circ \varphi}^{-1}\mathcal{G}$$

Observe that given a map $\alpha : \mathcal{H} \rightarrow \mathcal{F}$ of sheaves on \mathcal{C}_{total} we obtain a map $\mathcal{G} \rightarrow \mathcal{F}_n$ corresponding to the restriction of α_n to the component \mathcal{G} in \mathcal{H}_n . Conversely, given a map $\beta : \mathcal{G} \rightarrow \mathcal{F}_n$ of sheaves on \mathcal{C}_n we can define $\alpha : \mathcal{H} \rightarrow \mathcal{F}$ by letting α_m be the map which on components

$$f_\varphi^{-1}\mathcal{G} \rightarrow \mathcal{F}_m$$

uses the maps adjoint to $\mathcal{F}(\varphi) \circ f_\varphi^{-1}\beta$. We omit the arguments showing these two constructions give mutually inverse maps

$$Mor_{Sh(\mathcal{C}_n)}(\mathcal{G}, \mathcal{F}_n) = Mor_{Sh(\mathcal{C}_{total})}(\mathcal{H}, \mathcal{F})$$

Thus $\mathcal{H} = g_n^{Sh}\mathcal{G}$ as desired.

Proof of (4). If \mathcal{G} is an abelian sheaf on \mathcal{C}_n , then we proceed in exactly the same manner as above, except that we define \mathcal{H} is the abelian sheaf on \mathcal{C}_{total} whose degree m part is the sheaf

$$\bigoplus_{\varphi:[n]\rightarrow[m]} f_\varphi^{-1}\mathcal{G}$$

with transition maps defined exactly as above. The bijection

$$Mor_{Ab(\mathcal{C}_n)}(\mathcal{G}, \mathcal{F}_n) = Mor_{Ab(\mathcal{C}_{total})}(\mathcal{H}, \mathcal{F})$$

is proved exactly as above. Thus $\mathcal{H} = g_n!\mathcal{G}$ as desired.

The exactness properties of g_n^{Sh} and $g_n!$ follow from formulas given for these functors. \square

09WH **Lemma 3.6.** *In Situation 3.3. If \mathcal{I} is injective in $Ab(\mathcal{C}_{total})$, then \mathcal{I}_n is injective in $Ab(\mathcal{C}_n)$. If \mathcal{I}^\bullet is a K -injective complex in $Ab(\mathcal{C}_{total})$, then \mathcal{I}_n^\bullet is K -injective in $Ab(\mathcal{C}_n)$.*

Proof. The first statement follows from Homology, Lemma 26.1 and Lemma 3.5. The second statement from Derived Categories, Lemma 29.9 and Lemma 3.5. \square

4. Augmentations of simplicial sites

0D93 We continue in the fashion described in Section 3 working out the meaning of augmentations in cases A and B treated in that section.

0D6Z **Remark 4.1.** In Situation 3.3 an *augmentation* a_0 towards a site \mathcal{D} will mean

- (A) $a_0 : \mathcal{C}_0 \rightarrow \mathcal{D}$ is a morphism of sites given by a continuous functor $u_0 : \mathcal{D} \rightarrow \mathcal{C}_0$ such that for all $\varphi, \psi : [0] \rightarrow [n]$ we have $u_\varphi \circ u_0 = u_\psi \circ u_0$.
- (B) $a_0 : Sh(\mathcal{C}_0) \rightarrow Sh(\mathcal{D})$ is a morphism of topoi given by a cocontinuous functor $u_0 : \mathcal{C}_0 \rightarrow \mathcal{D}$ such that for all $\varphi, \psi : [0] \rightarrow [n]$ we have $u_0 \circ u_\varphi = u_0 \circ u_\psi$.

0D70 **Lemma 4.2.** *In Situation 3.3 let a_0 be an augmentation towards a site \mathcal{D} as in Remark 4.1. Then a_0 induces*

- (1) a morphism of topoi $a_n : Sh(\mathcal{C}_n) \rightarrow Sh(\mathcal{D})$ for all $n \geq 0$,
- (2) a morphism of topoi $a : Sh(\mathcal{C}_{total}) \rightarrow Sh(\mathcal{D})$

such that

- (1) for all $\varphi : [m] \rightarrow [n]$ we have $a_m \circ f_\varphi = a_n$,
- (2) if $g_n : Sh(\mathcal{C}_n) \rightarrow Sh(\mathcal{C}_{total})$ is as in Lemma 3.5, then $a \circ g_n = a_n$, and
- (3) $a_* \mathcal{F}$ for $\mathcal{F} \in Sh(\mathcal{C}_{total})$ is the equalizer of the two maps $a_{0,*} \mathcal{F}_0 \rightarrow a_{1,*} \mathcal{F}_1$.

Proof. Case A. Let $u_n : \mathcal{D} \rightarrow \mathcal{C}_n$ be the common value of the functors $u_\varphi \circ u_0$ for $\varphi : [0] \rightarrow [n]$. Then u_n corresponds to a morphism of sites $a_n : \mathcal{C}_n \rightarrow \mathcal{D}$, see Sites, Lemma 14.3. The same lemma shows that for all $\varphi : [m] \rightarrow [n]$ we have $a_m \circ f_\varphi = a_n$.

Case B. Let $u_n : \mathcal{C}_n \rightarrow \mathcal{D}$ be the common value of the functors $u_0 \circ u_\varphi$ for $\varphi : [0] \rightarrow [n]$. Then u_n is cocontinuous and hence defines a morphism of topoi $a_n : Sh(\mathcal{C}_n) \rightarrow Sh(\mathcal{D})$, see Sites, Lemma 20.2. The same lemma shows that for all $\varphi : [m] \rightarrow [n]$ we have $a_m \circ f_\varphi = a_n$.

Consider the functor $a^{-1} : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{C}_{total})$ which to a sheaf of sets \mathcal{G} associates the sheaf $\mathcal{F} = a^{-1} \mathcal{G}$ whose components are $a_n^{-1} \mathcal{G}$ and whose transition maps $\mathcal{F}(\varphi)$ are the identifications

$$f_\varphi^{-1} \mathcal{F}_m = f_\varphi^{-1} a_m^{-1} \mathcal{G} = a_n^{-1} \mathcal{G} = \mathcal{F}_n$$

for $\varphi : [m] \rightarrow [n]$, see the description of $Sh(\mathcal{C}_{total})$ in Lemma 3.4. Since the functors a_n^{-1} are exact, a^{-1} is an exact functor. Finally, for $a_* : Sh(\mathcal{C}_{total}) \rightarrow Sh(\mathcal{D})$ we take the functor which to a sheaf \mathcal{F} on $Sh(\mathcal{D})$ associates

$$a_* \mathcal{F} = \text{Equalizer}(a_{0,*} \mathcal{F}_0 \rightrightarrows a_{1,*} \mathcal{F}_1)$$

Here the two maps come from the two maps $\varphi : [0] \rightarrow [1]$ via

$$a_{0,*} \mathcal{F}_0 \rightarrow a_{0,*} f_{\varphi,*} f_\varphi^{-1} \mathcal{F}_0 \xrightarrow{\mathcal{F}(\varphi)} a_{0,*} f_{\varphi,*} \mathcal{F}_0 = a_{1,*} \mathcal{F}_1$$

where the first arrow comes from $1 \rightarrow f_{\varphi,*}f_{\varphi}^{-1}$. Let \mathcal{G}_{\bullet} denote the constant simplicial sheaf with value \mathcal{G} and let $a_{\bullet,*}\mathcal{F}$ denote the simplicial sheaf having $a_{n,*}\mathcal{F}_n$ in degree n . By the usual adjunction for the morphisms of topoi a_n we see that a map $a^{-1}\mathcal{G} \rightarrow \mathcal{F}$ is the same thing as a map

$$\mathcal{G}_{\bullet} \longrightarrow a_{\bullet,*}\mathcal{F}$$

of simplicial sheaves. By *Simplicial*, Lemma 20.2 this is the same thing as a map $\mathcal{G} \rightarrow a_*\mathcal{F}$. Thus a^{-1} and a_* are adjoint functors and we obtain our morphism of topoi a^2 . The equalities $a \circ g_n = f_n$ follow immediately from the definitions. \square

5. Morphisms of simplicial sites

0D94 We continue in the fashion described in Section 3 working out the meaning of morphisms of simplicial sites in cases A and B treated in that section.

0D95 **Remark 5.1.** Let $\mathcal{C}_n, f_{\varphi}, u_{\varphi}$ and $\mathcal{C}'_n, f'_{\varphi}, u'_{\varphi}$ be as in Situation 3.3. A *morphism h between simplicial sites* will mean

- (A) Morphisms of sites $h_n : \mathcal{C}_n \rightarrow \mathcal{C}'_n$ such that $f'_{\varphi} \circ h_n = h_n \circ f_{\varphi}$ as morphisms of sites for all $\varphi : [m] \rightarrow [n]$.
- (B) Cocontinuous functors $v_n : \mathcal{C}_n \rightarrow \mathcal{C}'_n$ inducing morphisms of topoi $h_n : Sh(\mathcal{C}_n) \rightarrow Sh(\mathcal{C}'_n)$ such that $u'_{\varphi} \circ v_n = v_n \circ u_{\varphi}$ as functors for all $\varphi : [m] \rightarrow [n]$.

In both cases we have $f'_{\varphi} \circ h_n = h_n \circ f_{\varphi}$ as morphisms of topoi, see *Sites*, Lemma 20.2 for case B and *Sites*, Definition 14.4 for case A.

0D96 **Lemma 5.2.** *Let $\mathcal{C}_n, f_{\varphi}, u_{\varphi}$ and $\mathcal{C}'_n, f'_{\varphi}, u'_{\varphi}$ be as in Situation 3.3. Let h be a morphism between simplicial sites as in Remark 5.1. Then we obtain a morphism of topoi*

$$h_{total} : Sh(\mathcal{C}_{total}) \rightarrow Sh(\mathcal{C}'_{total})$$

and commutative diagrams

$$\begin{array}{ccc} Sh(\mathcal{C}_n) & \xrightarrow{h_n} & Sh(\mathcal{C}'_n) \\ g_n \downarrow & & \downarrow g'_n \\ Sh(\mathcal{C}_{total}) & \xrightarrow{h_{total}} & Sh(\mathcal{C}'_{total}) \end{array}$$

Moreover, we have $(g'_n)^{-1} \circ h_{total,*} = h_{n,*} \circ g_n^{-1}$.

Proof. Case A. Say h_n corresponds to the continuous functor $v_n : \mathcal{C}'_n \rightarrow \mathcal{C}_n$. Then we can define a functor $v_{total} : \mathcal{C}'_{total} \rightarrow \mathcal{C}_{total}$ by using v_n in degree n . This is clearly a continuous functor (see definition of coverings in Lemma 3.1). Let $h_{total}^{-1} = v_{total,s} : Sh(\mathcal{C}'_{total}) \rightarrow Sh(\mathcal{C}_{total})$ and $h_{total,*} = v_{total}^s = v_{total}^p : Sh(\mathcal{C}_{total}) \rightarrow Sh(\mathcal{C}'_{total})$ be the adjoint pair of functors constructed and studied in *Sites*, Sections 13 and 14. To see that h_{total} is a morphism of topoi we still have to verify that h_{total}^{-1} is exact. We first observe that $(g'_n)^{-1} \circ h_{total,*} = h_{n,*} \circ g_n^{-1}$; this is immediate by computing sections over an object U of \mathcal{C}'_n . Thus, if we think of a sheaf \mathcal{F} on \mathcal{C}_{total} as a system $(\mathcal{F}_n, \mathcal{F}(\varphi))$ as in Lemma 3.4, then $h_{total,*}\mathcal{F}$ corresponds to the system $(h_{n,*}\mathcal{F}_n, h_{n,*}\mathcal{F}(\varphi))$. Clearly, the functor $(\mathcal{F}'_n, \mathcal{F}'(\varphi)) \rightarrow (h_n^{-1}\mathcal{F}'_n, h_n^{-1}\mathcal{F}'(\varphi))$ is its left adjoint. By uniqueness of adjoints, we conclude that h_{total}^{-1} is given by

²In case B the morphism a corresponds to the cocontinuous functor $\mathcal{C}_{total} \rightarrow \mathcal{D}$ sending U in \mathcal{C}_n to $u_n(U)$.

this rule on systems. In particular, h_{total}^{-1} is exact (by the description of sheaves on \mathcal{C}_{total} given in the lemma and the exactness of the functors h_n^{-1}) and we have our morphism of topoi. Finally, we obtain $g_n^{-1} \circ h_{total}^{-1} = h_n^{-1} \circ (g'_n)^{-1}$ as well, which proves that the displayed diagram of the lemma commutes.

Case B. Here we have a functor $v_{total} : \mathcal{C}_{total} \rightarrow \mathcal{C}'_{total}$ by using v_n in degree n . This is clearly a cocontinuous functor (see definition of coverings in Lemma 3.2). Let h_{total} be the morphism of topoi associated to v_{total} . The commutativity of the displayed diagram of the lemma follows immediately from Sites, Lemma 20.2. Taking left adjoints the final equality of the lemma becomes

$$h_{total}^{-1} \circ (g'_n)!^{Sh} = g_n^{Sh} \circ h_n^{-1}$$

This follows immediately from the explicit description of the functors $(g'_n)!^{Sh}$ and g_n^{Sh} in Lemma 3.5, the fact that $h_n^{-1} \circ (f'_\varphi)^{-1} = f_\varphi^{-1} \circ h_m^{-1}$ for $\varphi : [m] \rightarrow [n]$, and the fact that we already know h_{total}^{-1} commutes with restrictions to the degree n parts of the simplicial sites. \square

0D97 **Lemma 5.3.** *With notation and hypotheses as in Lemma 5.2. For $K \in D(\mathcal{C}_{total})$ we have $(g'_n)^{-1} Rh_{total,*} K = Rh_{n,*} g_n^{-1} K$.*

Proof. Let \mathcal{I}^\bullet be a K-injective complex on \mathcal{C}_{total} representing K . Then $g_n^{-1} K$ is represented by $g_n^{-1} \mathcal{I}^\bullet = \mathcal{I}_n^\bullet$ which is K-injective by Lemma 3.6. We have $(g'_n)^{-1} h_{total,*} \mathcal{I}^\bullet = h_{n,*} g_n^{-1} \mathcal{I}_n^\bullet$ by Lemma 5.2 which gives the desired equality. \square

0D98 **Remark 5.4.** Let $\mathcal{C}_n, f_\varphi, u_\varphi$ and $\mathcal{C}'_n, f'_\varphi, u'_\varphi$ be as in Situation 3.3. Let a_0 , resp. a'_0 be an augmentation towards a site \mathcal{D} , resp. \mathcal{D}' as in Remark 4.1. Let h be a morphism between simplicial sites as in Remark 5.1. We say a morphism of topoi $h_{-1} : Sh(\mathcal{D}) \rightarrow Sh(\mathcal{D}')$ is *compatible with h, a_0, a'_0* if

- (A) h_{-1} comes from a morphism of sites $h_{-1} : \mathcal{D} \rightarrow \mathcal{D}'$ such that $a'_0 \circ h_0 = h_{-1} \circ a_0$ as morphisms of sites.
- (B) h_{-1} comes from a cocontinuous functor $v_{-1} : \mathcal{D} \rightarrow \mathcal{D}'$ such that $u'_0 \circ v_0 = v_{-1} \circ u_0$ as functors.

In both cases we have $a'_0 \circ h_0 = h_{-1} \circ a_0$ as morphisms of topoi, see Sites, Lemma 20.2 for case B and Sites, Definition 14.4 for case A.

0D99 **Lemma 5.5.** *Let $\mathcal{C}_n, f_\varphi, u_\varphi, \mathcal{D}, a_0, \mathcal{C}'_n, f'_\varphi, u'_\varphi, \mathcal{D}', a'_0$, and $h_n, n \geq -1$ be as in Remark 5.4. Then we obtain a commutative diagram*

$$\begin{array}{ccc} Sh(\mathcal{C}_{total}) & \xrightarrow{h_{total}} & Sh(\mathcal{C}'_{total}) \\ a \downarrow & & \downarrow a' \\ Sh(\mathcal{D}) & \xrightarrow{h_{-1}} & Sh(\mathcal{D}') \end{array}$$

Proof. The morphism h is defined in Lemma 5.2. The morphisms a and a' are defined in Lemma 4.2. Thus the only thing is to prove the commutativity of the diagram. To do this, we prove that $a^{-1} \circ h_{-1}^{-1} = h_{total}^{-1} \circ (a')^{-1}$. By the commutative diagrams of Lemma 5.2 and the description of $Sh(\mathcal{C}_{total})$ and $Sh(\mathcal{C}'_{total})$ in terms of

components in Lemma 3.4, it suffices to show that

$$\begin{array}{ccc} Sh(\mathcal{C}_n) & \xrightarrow{h_n} & Sh(\mathcal{C}'_n) \\ a_n \downarrow & & \downarrow a'_n \\ Sh(\mathcal{D}) & \xrightarrow{h^{-1}} & Sh(\mathcal{D}') \end{array}$$

commutes for all n . This follows from the case for $n = 0$ (which is an assumption in Remark 5.4) and for $n > 0$ we pick $\varphi : [0] \rightarrow [n]$ and then the required commutativity follows from the case $n = 0$ and the relations $a_n = a_0 \circ f_\varphi$ and $a'_n = a'_0 \circ f'_\varphi$ as well as the commutation relations $f'_\varphi \circ h_n = h_0 \circ f_\varphi$. \square

6. Ringed simplicial sites

0D71 Let us endow our simplicial topos with a sheaf of rings.

0D72 **Lemma 6.1.** *In Situation 3.3. Let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} . There is a canonical morphism of ringed topoi $g_n : (Sh(\mathcal{C}_n), \mathcal{O}_n) \rightarrow (Sh(\mathcal{C}_{total}), \mathcal{O})$ agreeing with the morphism g_n of Lemma 3.5 on underlying topoi. The functor $g_n^* : Mod(\mathcal{O}) \rightarrow Mod(\mathcal{O}_n)$ has a left adjoint $g_{n!}$. For \mathcal{G} in $Mod(\mathcal{O}_n)$ -modules the restriction of $g_{n!}\mathcal{G}$ to \mathcal{C}_m is*

$$\bigoplus_{\varphi: [n] \rightarrow [m]} f_\varphi^* \mathcal{G}$$

where $f_\varphi : (Sh(\mathcal{C}_m), \mathcal{O}_m) \rightarrow (Sh(\mathcal{C}_n), \mathcal{O}_n)$ is the morphism of ringed topoi agreeing with the previously defined f_φ on topoi and using the map $\mathcal{O}(\varphi) : f_\varphi^{-1}\mathcal{O}_n \rightarrow \mathcal{O}_m$ on sheaves of rings.

Proof. By Lemma 3.5 we have $g_n^{-1}\mathcal{O} = \mathcal{O}_n$ and hence we obtain our morphism of ringed topoi. By Modules on Sites, Lemma 40.1 we obtain the adjoint $g_{n!}$. To prove the formula for $g_{n!}$ we first define a sheaf of \mathcal{O} -modules \mathcal{H} on \mathcal{C}_{total} with degree m component the \mathcal{O}_m -module

$$\mathcal{H}_m = \bigoplus_{\varphi: [n] \rightarrow [m]} f_\varphi^* \mathcal{G}$$

Given a map $\psi : [m] \rightarrow [m']$ the map $\mathcal{H}(\psi) : f_\psi^{-1}\mathcal{H}_m \rightarrow \mathcal{H}_{m'}$ is given on components by

$$f_\psi^{-1} f_\varphi^* \mathcal{G} \rightarrow f_\psi^* f_\varphi^* \mathcal{G} \rightarrow f_{\psi \circ \varphi}^* \mathcal{G}$$

Since this map $f_\psi^{-1}\mathcal{H}_m \rightarrow \mathcal{H}_{m'}$ is $\mathcal{O}(\psi) : f_\psi^{-1}\mathcal{O}_m \rightarrow \mathcal{O}_{m'}$ -semi-linear, this indeed does define an \mathcal{O} -module (use Lemma 3.4). Then one proves directly that

$$Mor_{\mathcal{O}_n}(\mathcal{G}, \mathcal{F}_n) = Mor_{\mathcal{O}}(\mathcal{H}, \mathcal{F})$$

proceeding as in the proof of Lemma 3.5. Thus $\mathcal{H} = g_{n!}\mathcal{G}$ as desired. \square

0D73 **Lemma 6.2.** *In Situation 3.3. Let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} . If \mathcal{I} is injective in $Mod(\mathcal{O})$, then \mathcal{I}_n is a limp sheaf on \mathcal{C}_n .*

Proof. This follows from Cohomology on Sites, Lemma 30.4 applied to the inclusion functor $\mathcal{C}_n \rightarrow \mathcal{C}_{total}$ and its properties proven in Lemma 3.5. \square

0D74 **Lemma 6.3.** *With assumptions as in Lemma 6.1 the functor $g_{n!} : Mod(\mathcal{O}_n) \rightarrow Mod(\mathcal{O})$ is exact if the maps $f_\varphi^{-1}\mathcal{O}_n \rightarrow \mathcal{O}_m$ are flat for all $\varphi : [n] \rightarrow [m]$.*

Proof. Recall that $g_n! \mathcal{G}$ is the \mathcal{O} -module whose degree m part is the \mathcal{O}_m -module

$$\bigoplus_{\varphi: [n] \rightarrow [m]} f_\varphi^* \mathcal{G}$$

Here the morphism of ringed topoi $f_\varphi : (Sh(\mathcal{C}_m), \mathcal{O}_m) \rightarrow (Sh(\mathcal{C}_n), \mathcal{O}_n)$ uses the map $f_\varphi^{-1} \mathcal{O}_n \rightarrow \mathcal{O}_m$ of the statement of the lemma. If these maps are flat, then f_φ^* is exact (Modules on Sites, Lemma 30.2). By definition of the site \mathcal{C}_{total} we see that these functors have the desired exactness properties and we conclude. \square

0D75 **Lemma 6.4.** *In Situation 3.3. Let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} such that $f_\varphi^{-1} \mathcal{O}_n \rightarrow \mathcal{O}_m$ is flat for all $\varphi : [n] \rightarrow [m]$. If \mathcal{I} is injective in $Mod(\mathcal{O})$, then \mathcal{I}_n is injective in $Mod(\mathcal{O}_n)$.*

Proof. This follows from Homology, Lemma 26.1 and Lemma 6.3. \square

7. Morphisms of ringed simplicial sites

0DGY We continue the discussion of Section 5.

0DGZ **Remark 7.1.** Let $\mathcal{C}_n, f_\varphi, u_\varphi$ and $\mathcal{C}'_n, f'_\varphi, u'_\varphi$ be as in Situation 3.3. Let \mathcal{O} and \mathcal{O}' be a sheaf of rings on \mathcal{C}_{total} and \mathcal{C}'_{total} . We will say that (h, h^\sharp) is a *morphism between ringed simplicial sites* if h is a morphism between simplicial sites as in Remark 5.1 and $h^\sharp : h_{total}^{-1} \mathcal{O}' \rightarrow \mathcal{O}$ or equivalently $h^\sharp : \mathcal{O}' \rightarrow h_{total,*} \mathcal{O}$ is a homomorphism of sheaves of rings.

0DH0 **Lemma 7.2.** *Let $\mathcal{C}_n, f_\varphi, u_\varphi$ and $\mathcal{C}'_n, f'_\varphi, u'_\varphi$ be as in Situation 3.3. Let \mathcal{O} and \mathcal{O}' be a sheaf of rings on \mathcal{C}_{total} and \mathcal{C}'_{total} . Let (h, h^\sharp) be a morphism between simplicial sites as in Remark 7.1. Then we obtain a morphism of ringed topoi*

$$h_{total} : (Sh(\mathcal{C}_{total}, \mathcal{O}) \rightarrow (Sh(\mathcal{C}'_{total}), \mathcal{O}'))$$

and commutative diagrams

$$\begin{array}{ccc} (Sh(\mathcal{C}_n), \mathcal{O}_n) & \xrightarrow{h_n} & (Sh(\mathcal{C}'_n), \mathcal{O}'_n) \\ g_n \downarrow & & \downarrow g'_n \\ (Sh(\mathcal{C}_{total}), \mathcal{O}) & \xrightarrow{h_{total}} & (Sh(\mathcal{C}'_{total}), \mathcal{O}') \end{array}$$

of ringed topoi where g_n and g'_n are as in Lemma 6.1. Moreover, we have $(g'_n)^* \circ h_{total,*} = h_{n,*} \circ g_n^*$ as functor $Mod(\mathcal{O}) \rightarrow Mod(\mathcal{O}'_n)$.

Proof. Follows from Lemma 5.2 and 6.1 by keeping track of the sheaves of rings. A small point is that in order to define h_n as a morphism of ringed topoi we set $h_n^\sharp = g_n^{-1} h^\sharp : g_n^{-1} h_{total}^{-1} \mathcal{O}' \rightarrow g_n^{-1} \mathcal{O}$ which makes sense because $g_n^{-1} h_{total}^{-1} \mathcal{O}' = h_n^{-1} (g'_n)^{-1} \mathcal{O}' = h_n^{-1} \mathcal{O}'_n$ and $g_n^{-1} \mathcal{O} = \mathcal{O}_n$. Note that $g_n^* \mathcal{F} = g_n^{-1} \mathcal{F}$ for a sheaf of \mathcal{O} -modules \mathcal{F} and similarly for g'_n and this helps explain why $(g'_n)^* \circ h_{total,*} = h_{n,*} \circ g_n^*$ follows from the corresponding statement of Lemma 5.2. \square

0DH1 **Lemma 7.3.** *With notation and hypotheses as in Lemma 7.2. For $K \in D(\mathcal{O})$ we have $(g'_n)^* Rh_{total,*} K = Rh_{n,*} g_n^* K$.*

Proof. Recall that $g_n^* = g_n^{-1}$ because $g_n^{-1} \mathcal{O} = \mathcal{O}_n$ by the construction in Lemma 6.1. In particular g_n^* is exact and Lg_n^* is given by applying g_n^* to any representative complex of modules. Similarly for g'_n . There is a canonical base change map

$(g'_n)^* Rh_{total,*} K \rightarrow Rh_{n,*} g_n^* K$, see Cohomology on Sites, Remark 20.3. By Cohomology on Sites, Lemma 21.7 the image of this in $D(\mathcal{C}'_n)$ is the map $(g'_n)^{-1} Rh_{total,*} K_{ab} \rightarrow Rh_{n,*} g_n^{-1} K_{ab}$ where K_{ab} is the image of K in $D(\mathcal{C}_{total})$. This we proved to be an isomorphism in Lemma 5.3 and the result follows. \square

8. Cohomology on simplicial sites

0D76 Let \mathcal{C} be as in Situation 3.3. In statement of the following lemmas we will let $g_n : Sh(\mathcal{C}_n) \rightarrow Sh(\mathcal{C}_{total})$ be the morphism of topoi of Lemma 3.5. If $\varphi : [m] \rightarrow [n]$ is a morphism of Δ , then the diagram of topoi

$$\begin{array}{ccc} Sh(\mathcal{C}_n) & \xrightarrow{\quad f_\varphi \quad} & Sh(\mathcal{C}_m) \\ & \searrow g_n & \swarrow g_m \\ & Sh(\mathcal{C}_{total}) & \end{array}$$

is not commutative, but there is a 2-morphism $g_n \rightarrow g_m \circ f_\varphi$ coming from the maps $\mathcal{F}(\varphi) : f_\varphi^{-1} \mathcal{F}_m \rightarrow \mathcal{F}_n$. See Sites, Section 35.

09WI **Lemma 8.1.** *In Situation 3.3 and with notation as above there is a complex*

$$\dots \rightarrow g_{2!} \mathbf{Z} \rightarrow g_{1!} \mathbf{Z} \rightarrow g_{0!} \mathbf{Z}$$

of abelian sheaves on \mathcal{C}_{total} which forms a resolution of the constant sheaf with value \mathbf{Z} on \mathcal{C}_{total} .

Proof. We will use the description of the functors $g_{n!}$ in Lemma 3.5 without further mention. As maps of the complex we take $\sum (-1)^i d_i^n$ where $d_i^n : g_{n!} \mathbf{Z} \rightarrow g_{n-1!} \mathbf{Z}$ is the adjoint to the map $\mathbf{Z} \rightarrow \bigoplus_{[n-1] \rightarrow [n]} \mathbf{Z} = g_n^{-1} g_{n-1!} \mathbf{Z}$ corresponding to the factor labeled with $\delta_i^n : [n-1] \rightarrow [n]$. Then g_m^{-1} applied to the complex gives the complex

$$\dots \rightarrow \bigoplus_{\alpha \in Mor_\Delta([2],[m])} \mathbf{Z} \rightarrow \bigoplus_{\alpha \in Mor_\Delta([1],[m])} \mathbf{Z} \rightarrow \bigoplus_{\alpha \in Mor_\Delta([0],[m])} \mathbf{Z}$$

on \mathcal{C}_m . In other words, this is the complex associated to the free abelian sheaf on the simplicial set $\Delta[m]$, see Simplicial, Example 11.2. Since $\Delta[m]$ is homotopy equivalent to $\Delta[0]$, see Simplicial, Example 26.7, and since “taking free abelian sheaf on” is a functor, we see that the complex above is homotopy equivalent to the free abelian sheaf on $\Delta[0]$ (Simplicial, Remark 26.4 and Lemma 27.2). This complex is acyclic in positive degrees and equal to \mathbf{Z} in degree 0. \square

0D77 **Lemma 8.2.** *In Situation 3.3. Let \mathcal{F} be an abelian sheaf on \mathcal{C}_{total} there is a canonical complex*

$$0 \rightarrow \Gamma(\mathcal{C}_{total}, \mathcal{F}) \rightarrow \Gamma(\mathcal{C}_0, \mathcal{F}_0) \rightarrow \Gamma(\mathcal{C}_1, \mathcal{F}_1) \rightarrow \Gamma(\mathcal{C}_2, \mathcal{F}_2) \rightarrow \dots$$

which is exact in degrees $-1, 0$ and exact everywhere if \mathcal{F} is injective.

Proof. Observe that $\text{Hom}(\mathbf{Z}, \mathcal{F}) = \Gamma(\mathcal{C}_{total}, \mathcal{F})$ and $\text{Hom}(g_{n!} \mathbf{Z}, \mathcal{F}) = \Gamma(\mathcal{C}_n, \mathcal{F}_n)$. Hence this lemma is an immediate consequence of Lemma 8.1 and the fact that $\text{Hom}(-, \mathcal{F})$ is exact if \mathcal{F} is injective. \square

09WJ **Lemma 8.3.** *In Situation 3.3. For K in $D^+(\mathcal{C}_{total})$ there is a spectral sequence $(E_r, d_r)_{r \geq 0}$ with*

$$E_1^{p,q} = H^q(\mathcal{C}_p, K_p), \quad d_1^{p,q} : E_1^{p,q} \rightarrow E_1^{p+1,q}$$

converging to $H^{p+q}(\mathcal{C}_{total}, K)$. This spectral sequence is functorial in K .

Proof. Let \mathcal{I}^\bullet be a bounded below complex of injectives representing K . Consider the double complex with terms

$$A^{p,q} = \Gamma(\mathcal{C}_p, \mathcal{I}_p^q)$$

where the horizontal arrows come from Lemma 8.2 and the vertical arrows from the differentials of the complex \mathcal{I}^\bullet . The rows of the double complex are exact in positive degrees and evaluate to $\Gamma(\mathcal{C}_{total}, \mathcal{I}^q)$ in degree 0. On the other hand, since restriction to \mathcal{C}_p is exact (Lemma 3.5) the complex \mathcal{I}_p^\bullet represents K_p in $D(\mathcal{C}_p)$. The sheaves \mathcal{I}_p^q are injective abelian sheaves on \mathcal{C}_p (Lemma 3.6). Hence the cohomology of the columns computes the groups $H^q(\mathcal{C}_p, K_p)$. We conclude by applying Homology, Lemmas 22.6 and 22.7. \square

0DBZ **Lemma 8.4.** *Let \mathcal{C} be as in Situation 3.3. Let $U \in \text{Ob}(\mathcal{C}_n)$. Let $\mathcal{F} \in \text{Ab}(\mathcal{C}_{total})$. Then $H^p(U, \mathcal{F}) = H^p(U, g_n^{-1}\mathcal{F})$ where on the left hand side U is viewed as an object of \mathcal{C}_{total} .*

Proof. Observe that “ U viewed as object of \mathcal{C}_{total} ” is explained by the construction of \mathcal{C}_{total} in Lemma 3.1 in case (A) and Lemma 3.2 in case (B). The equality then follows from Lemma 3.6 and the definition of cohomology. \square

9. Cohomology and augmentations of simplicial sites

0D9A Consider a simplicial site \mathcal{C} as in Situation 3.3. Let a_0 be an augmentation towards a site \mathcal{D} as in Remark 4.1. By Lemma 4.2 we obtain a morphism of topoi

$$a : \text{Sh}(\mathcal{C}_{total}) \longrightarrow \text{Sh}(\mathcal{D})$$

and morphisms of topoi $g_n : \text{Sh}(\mathcal{C}_n) \rightarrow \text{Sh}(\mathcal{C}_{total})$ as in Lemma 3.5. The compositions $a \circ g_n$ are denoted $a_n : \text{Sh}(\mathcal{C}_n) \rightarrow \text{Sh}(\mathcal{D})$. Furthermore, the simplicial structure gives morphisms of topoi $f_\varphi : \text{Sh}(\mathcal{C}_n) \rightarrow \text{Sh}(\mathcal{C}_m)$ such that $a_n \circ f_\varphi = a_m$ for all $\varphi : [m] \rightarrow [n]$.

0D78 **Lemma 9.1.** *In Situation 3.3 let a_0 be an augmentation towards a site \mathcal{D} as in Remark 4.1. For any abelian sheaf \mathcal{G} on \mathcal{D} there is an exact complex*

$$\dots \rightarrow g_{2!}(a_2^{-1}\mathcal{G}) \rightarrow g_{1!}(a_1^{-1}\mathcal{G}) \rightarrow g_{0!}(a_0^{-1}\mathcal{G}) \rightarrow a^{-1}\mathcal{G} \rightarrow 0$$

of abelian sheaves on \mathcal{C}_{total} .

Proof. We encourage the reader to read the proof of Lemma 8.1 first. We will use Lemma 4.2 and the description of the functors $g_{n!}$ in Lemma 3.5 without further mention. In particular $g_{n!}(a_n^{-1}\mathcal{G})$ is the sheaf on \mathcal{C}_{total} whose restriction to \mathcal{C}_m is the sheaf

$$\bigoplus_{\varphi: [n] \rightarrow [m]} f_\varphi^{-1} a_n^{-1} \mathcal{G} = \bigoplus_{\varphi: [n] \rightarrow [m]} a_m^{-1} \mathcal{G}$$

As maps of the complex we take $\sum (-1)^i d_i^n$ where $d_i^n : g_{n!}(a_n^{-1}\mathcal{G}) \rightarrow g_{(n-1)!}(a_{n-1}^{-1}\mathcal{G})$ is the adjoint to the map $a_n^{-1}\mathcal{G} \rightarrow \bigoplus_{[n-1] \rightarrow [n]} a_n^{-1}\mathcal{G} = g_n^{-1}g_{(n-1)!}(a_{n-1}^{-1}\mathcal{G})$ corresponding to the factor labeled with $\delta_i^n : [n-1] \rightarrow [n]$. The map $g_{0!}(a_0^{-1}\mathcal{G}) \rightarrow a^{-1}\mathcal{G}$ is adjoint to the identity map of $a_0^{-1}\mathcal{G}$. Then g_m^{-1} applied to the chain complex in degrees $\dots, 2, 1, 0$ gives the complex

$$\dots \rightarrow \bigoplus_{\alpha \in \text{Mor}_\Delta([2], [m])} a_m^{-1}\mathcal{G} \rightarrow \bigoplus_{\alpha \in \text{Mor}_\Delta([1], [m])} a_m^{-1}\mathcal{G} \rightarrow \bigoplus_{\alpha \in \text{Mor}_\Delta([0], [m])} a_m^{-1}\mathcal{G}$$

on \mathcal{C}_m . This is equal to $a_m^{-1}\mathcal{G}$ tensored over the constant sheaf \mathbf{Z} with the complex

$$\dots \rightarrow \bigoplus_{\alpha \in \text{Mor}_{\Delta}([2],[m])} \mathbf{Z} \rightarrow \bigoplus_{\alpha \in \text{Mor}_{\Delta}([1],[m])} \mathbf{Z} \rightarrow \bigoplus_{\alpha \in \text{Mor}_{\Delta}([0],[m])} \mathbf{Z}$$

discussed in the proof of Lemma 8.1. There we have seen that this complex is homotopy equivalent to \mathbf{Z} placed in degree 0 which finishes the proof. \square

0D79 **Lemma 9.2.** *In Situation 3.3 let a_0 be an augmentation towards a site \mathcal{D} as in Remark 4.1. For an abelian sheaf \mathcal{F} on \mathcal{C}_{total} there is a canonical complex*

$$0 \rightarrow a_*\mathcal{F} \rightarrow a_{0,*}\mathcal{F}_0 \rightarrow a_{1,*}\mathcal{F}_1 \rightarrow a_{2,*}\mathcal{F}_2 \rightarrow \dots$$

on \mathcal{D} which is exact in degrees $-1, 0$ and exact everywhere if \mathcal{F} is injective.

Proof. To construct the complex, by the Yoneda lemma, it suffices for any abelian sheaf \mathcal{G} on \mathcal{D} to construct a complex

$$0 \rightarrow \text{Hom}(\mathcal{G}, a_*\mathcal{F}) \rightarrow \text{Hom}(\mathcal{G}, a_{0,*}\mathcal{F}_0) \rightarrow \text{Hom}(\mathcal{G}, a_{1,*}\mathcal{F}_1) \rightarrow \dots$$

functorially in \mathcal{G} . To do this apply $\text{Hom}(-, \mathcal{F})$ to the exact complex of Lemma 9.1 and use adjointness of pullback and pushforward. The exactness properties in degrees $-1, 0$ follow from the construction as $\text{Hom}(-, \mathcal{F})$ is left exact. If \mathcal{F} is an injective abelian sheaf, then the complex is exact because $\text{Hom}(-, \mathcal{F})$ is exact. \square

0D7A **Lemma 9.3.** *In Situation 3.3 let a_0 be an augmentation towards a site \mathcal{D} as in Remark 4.1. For any K in $D^+(\mathcal{C}_{total})$ there is a spectral sequence $(E_r, d_r)_{r \geq 0}$ with*

$$E_1^{p,q} = R^q a_{p,*} K_p, \quad d_1^{p,q} : E_1^{p,q} \rightarrow E_1^{p+1,q}$$

converging to $R^{p+q} a_* K$. This spectral sequence is functorial in K .

Proof. Let \mathcal{I}^\bullet be a bounded below complex of injectives representing K . Consider the double complex with terms

$$A^{p,q} = a_{p,*} \mathcal{I}_p^q$$

where the horizontal arrows come from Lemma 9.2 and the vertical arrows from the differentials of the complex \mathcal{I}^\bullet . The rows of the double complex are exact in positive degrees and evaluate to $a_* \mathcal{I}^q$ in degree 0. On the other hand, since restriction to \mathcal{C}_p is exact (Lemma 3.5) the complex \mathcal{I}_p^\bullet represents K_p in $D(\mathcal{C}_p)$. The sheaves \mathcal{I}_p^q are injective abelian sheaves on \mathcal{C}_p (Lemma 3.6). Hence the cohomology of the columns computes $R^q a_{p,*} K_p$. We conclude by applying Homology, Lemmas 22.6 and 22.7. \square

10. Cohomology on ringed simplicial sites

0D7B This section is the analogue of Section 8 for sheaves of modules.

In Situation 3.3 let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} . In statement of the following lemmas we will let $g_n : (\text{Sh}(\mathcal{C}_n), \mathcal{O}_n) \rightarrow (\text{Sh}(\mathcal{C}_{total}), \mathcal{O})$ be the morphism of ringed topoi of Lemma 6.1. If $\varphi : [m] \rightarrow [n]$ is a morphism of Δ , then the diagram of ringed topoi

$$\begin{array}{ccc} (\text{Sh}(\mathcal{C}_n), \mathcal{O}_n) & \xrightarrow{f_\varphi} & (\text{Sh}(\mathcal{C}_m), \mathcal{O}_m) \\ & \searrow g_n & \swarrow g_m \\ & (\text{Sh}(\mathcal{C}_{total}), \mathcal{O}) & \end{array}$$

is not commutative, but there is a 2-morphism $g_n \rightarrow g_m \circ f_\varphi$ coming from the maps $\mathcal{F}(\varphi) : f_\varphi^{-1}\mathcal{F}_m \rightarrow \mathcal{F}_n$. See Sites, Section 35.

0D9B **Lemma 10.1.** *In Situation 3.3 let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} . There is a complex*

$$\dots \rightarrow g_2!\mathcal{O}_2 \rightarrow g_1!\mathcal{O}_1 \rightarrow g_0!\mathcal{O}_0$$

of \mathcal{O} -modules which forms a resolution of \mathcal{O} . Here $g_n!$ is as in Lemma 6.1.

Proof. We will use the description of $g_n!$ given in Lemma 3.5. As maps of the complex we take $\sum(-1)^i d_i^n$ where $d_i^n : g_n!\mathcal{O}_n \rightarrow g_{n-1}!\mathcal{O}_{n-1}$ is the adjoint to the map $\mathcal{O}_n \rightarrow \bigoplus_{[n-1] \rightarrow [n]} \mathcal{O}_n = g_n^* g_{n-1}!\mathcal{O}_{n-1}$ corresponding to the factor labeled with $\delta_i^n : [n-1] \rightarrow [n]$. Then g_m^{-1} applied to the complex gives the complex

$$\dots \rightarrow \bigoplus_{\alpha \in \text{Mor}_\Delta([2],[m])} \mathcal{O}_m \rightarrow \bigoplus_{\alpha \in \text{Mor}_\Delta([1],[m])} \mathcal{O}_m \rightarrow \bigoplus_{\alpha \in \text{Mor}_\Delta([0],[m])} \mathcal{O}_m$$

on \mathcal{C}_m . In other words, this is the complex associated to the free \mathcal{O}_m -module on the simplicial set $\Delta[m]$, see Simplicial, Example 11.2. Since $\Delta[m]$ is homotopy equivalent to $\Delta[0]$, see Simplicial, Example 26.7, and since “taking free abelian sheaf on” is a functor, we see that the complex above is homotopy equivalent to the free abelian sheaf on $\Delta[0]$ (Simplicial, Remark 26.4 and Lemma 27.2). This complex is acyclic in positive degrees and equal to \mathcal{O}_m in degree 0. \square

0D9C **Lemma 10.2.** *In Situation 3.3 let \mathcal{O} be a sheaf of rings. Let \mathcal{F} be a sheaf of \mathcal{O} -modules. There is a canonical complex*

$$0 \rightarrow \Gamma(\mathcal{C}_{total}, \mathcal{F}) \rightarrow \Gamma(\mathcal{C}_0, \mathcal{F}_0) \rightarrow \Gamma(\mathcal{C}_1, \mathcal{F}_1) \rightarrow \Gamma(\mathcal{C}_2, \mathcal{F}_2) \rightarrow \dots$$

which is exact in degrees $-1, 0$ and exact everywhere if \mathcal{F} is an injective \mathcal{O} -module.

Proof. Observe that $\text{Hom}(\mathcal{O}, \mathcal{F}) = \Gamma(\mathcal{C}_{total}, \mathcal{F})$ and $\text{Hom}(g_n!\mathcal{O}_n, \mathcal{F}) = \Gamma(\mathcal{C}_n, \mathcal{F}_n)$. Hence this lemma is an immediate consequence of Lemma 10.1 and the fact that $\text{Hom}(-, \mathcal{F})$ is exact if \mathcal{F} is injective. \square

0D7E **Lemma 10.3.** *In Situation 3.3 let \mathcal{O} be a sheaf of rings. For K in $D^+(\mathcal{O})$ there is a spectral sequence $(E_r, d_r)_{r \geq 0}$ with*

$$E_1^{p,q} = H^q(\mathcal{C}_p, K_p), \quad d_1^{p,q} : E_1^{p,q} \rightarrow E_1^{p+1,q}$$

converging to $H^{p+q}(\mathcal{C}_{total}, K)$. This spectral sequence is functorial in K .

Proof. Let \mathcal{I}^\bullet be a bounded below complex of injective \mathcal{O} -modules representing K . Consider the double complex with terms

$$A^{p,q} = \Gamma(\mathcal{C}_p, \mathcal{I}_p^q)$$

where the horizontal arrows come from Lemma 10.2 and the vertical arrows from the differentials of the complex \mathcal{I}^\bullet . Observe that $\Gamma(\mathcal{D}, -) = \text{Hom}_{\mathcal{O}_{\mathcal{D}}}(\mathcal{O}_{\mathcal{D}}, -)$ on $\text{Mod}(\mathcal{O}_{\mathcal{D}})$. Hence the lemma says rows of the double complex are exact in positive degrees and evaluate to $\Gamma(\mathcal{C}_{total}, \mathcal{I}^q)$ in degree 0. Thus the total complex associated to the double complex computes $R\Gamma(\mathcal{C}_{total}, K)$ by Homology, Lemma 22.7. On the other hand, since restriction to \mathcal{C}_p is exact (Lemma 3.5) the complex \mathcal{I}_p^\bullet represents K_p in $D(\mathcal{C}_p)$. The sheaves \mathcal{I}_p^q are limp on \mathcal{C}_p (Lemma 6.2). Hence the cohomology of the columns computes the groups $H^q(\mathcal{C}_p, K_p)$ by Leray’s acyclicity lemma (Derived Categories, Lemma 17.7) and Cohomology on Sites, Lemma 15.3. We conclude by applying Homology, Lemma 22.6. \square

0DH2 **Lemma 10.4.** *In Situation 3.3 let \mathcal{O} be a sheaf of rings. Let $U \in \text{Ob}(\mathcal{C}_n)$. Let $\mathcal{F} \in \text{Mod}(\mathcal{O})$. Then $H^p(U, \mathcal{F}) = H^p(U, g_n^* \mathcal{F})$ where on the left hand side U is viewed as an object of \mathcal{C}_{total} .*

Proof. Observe that “ U viewed as object of \mathcal{C}_{total} ” is explained by the construction of \mathcal{C}_{total} in Lemma 3.1 in case (A) and Lemma 3.2 in case (B). In both cases the functor $\mathcal{C}_n \rightarrow \mathcal{C}$ is continuous and cocontinuous, see Lemma 3.5, and $g_n^{-1} \mathcal{O} = \mathcal{O}_n$ by definition. Hence the result is a special case of Cohomology on Sites, Lemma 30.5. \square

11. Cohomology and augmentations of ringed simplicial sites

0D9D This section is the analogue of Section 9 for sheaves of modules.

Consider a simplicial site \mathcal{C} as in Situation 3.3. Let a_0 be an augmentation towards a site \mathcal{D} as in Remark 4.1. Let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} . Let $\mathcal{O}_{\mathcal{D}}$ be a sheaf of rings on \mathcal{D} . Suppose we are given a morphism

$$a^\sharp : \mathcal{O}_{\mathcal{D}} \longrightarrow a_* \mathcal{O}$$

where a is as in Lemma 4.2. Consequently, we obtain a morphism of ringed topoi

$$a : (Sh(\mathcal{C}_{total}), \mathcal{O}) \longrightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$$

We will think of $g_n : (Sh(\mathcal{C}_n), \mathcal{O}_n) \rightarrow (Sh(\mathcal{C}_{total}), \mathcal{O})$ as a morphism of ringed topoi as in Lemma 6.1, then taking the composition $a_n = a \circ g_n$ (Lemma 4.2) as morphisms of ringed topoi we obtain

$$a_n : (Sh(\mathcal{C}_n), \mathcal{O}_n) \longrightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$$

Using the transition maps $f_\varphi^{-1} \mathcal{O}_m \rightarrow \mathcal{O}_n$ we obtain morphisms of ringed topoi

$$f_\varphi : (Sh(\mathcal{C}_n), \mathcal{O}_n) \rightarrow (Sh(\mathcal{C}_m), \mathcal{O}_m)$$

such that $a_n \circ f_\varphi = a_m$ as morphisms of ringed topoi for all $\varphi : [m] \rightarrow [n]$.

0DH3 **Lemma 11.1.** *With notation as above. The morphism $a : (Sh(\mathcal{C}_{total}), \mathcal{O}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ is flat if and only if $a_n : (Sh(\mathcal{C}_n), \mathcal{O}_n) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ is flat for $n \geq 0$.*

Proof. Since $g_n : (Sh(\mathcal{C}_n), \mathcal{O}_n) \rightarrow (Sh(\mathcal{C}_{total}), \mathcal{O})$ is flat, we see that if a is flat, then $a_n = a \circ g_n$ is flat as a composition. Conversely, suppose that a_n is flat for all n . We have to check that \mathcal{O} is flat as a sheaf of $a^{-1} \mathcal{O}_{\mathcal{D}}$ -modules. Let $\mathcal{F} \rightarrow \mathcal{G}$ be an injective map of $a^{-1} \mathcal{O}_{\mathcal{D}}$ -modules. We have to show that

$$\mathcal{F} \otimes_{a^{-1} \mathcal{O}_{\mathcal{D}}} \mathcal{O} \rightarrow \mathcal{G} \otimes_{a^{-1} \mathcal{O}_{\mathcal{D}}} \mathcal{O}$$

is injective. We can check this on \mathcal{C}_n , i.e., after applying g_n^{-1} . Since $g_n^* = g_n^{-1}$ because $g_n^{-1} \mathcal{O} = \mathcal{O}_n$ we obtain

$$g_n^{-1} \mathcal{F} \otimes_{g_n^{-1} a^{-1} \mathcal{O}_{\mathcal{D}}} \mathcal{O}_n \rightarrow g_n^{-1} \mathcal{G} \otimes_{g_n^{-1} a^{-1} \mathcal{O}_{\mathcal{D}}} \mathcal{O}_n$$

which is injective because $g_n^{-1} a^{-1} \mathcal{O}_{\mathcal{D}} = a_n^{-1} \mathcal{O}_{\mathcal{D}}$ and we assume a_n was flat. \square

0D7C **Lemma 11.2.** *With notation as above. For a $\mathcal{O}_{\mathcal{D}}$ -module \mathcal{G} there is an exact complex*

$$\dots \rightarrow g_{2!}(a_2^* \mathcal{G}) \rightarrow g_{1!}(a_1^* \mathcal{G}) \rightarrow g_{0!}(a_0^* \mathcal{G}) \rightarrow a^* \mathcal{G} \rightarrow 0$$

of sheaves of \mathcal{O} -modules on \mathcal{C}_{total} . Here $g_n!$ is as in Lemma 6.1.

Proof. Observe that $a^*\mathcal{G}$ is the \mathcal{O} -module on \mathcal{C}_{total} whose restriction to \mathcal{C}_m is the \mathcal{O}_m -module $a_m^*\mathcal{G}$. The description of the functors $g_n!$ on modules in Lemma 6.1 shows that $g_n!(a_n^*\mathcal{G})$ is the \mathcal{O} -module on \mathcal{C}_{total} whose restriction to \mathcal{C}_m is the \mathcal{O}_m -module

$$\bigoplus_{\varphi:[n]\rightarrow[m]} f_\varphi^* a_n^* \mathcal{G} = \bigoplus_{\varphi:[n]\rightarrow[m]} a_m^* \mathcal{G}$$

The rest of the proof is exactly the same as the proof of Lemma 9.1, replacing $a_m^{-1}\mathcal{G}$ by $a_m^*\mathcal{G}$. \square

0D7D **Lemma 11.3.** *With notation as above. For an \mathcal{O} -module \mathcal{F} on \mathcal{C}_{total} there is a canonical complex*

$$0 \rightarrow a_*\mathcal{F} \rightarrow a_{0,*}\mathcal{F}_0 \rightarrow a_{1,*}\mathcal{F}_1 \rightarrow a_{2,*}\mathcal{F}_2 \rightarrow \dots$$

of $\mathcal{O}_{\mathcal{D}}$ -modules which is exact in degrees $-1, 0$. If \mathcal{F} is an injective \mathcal{O} -module, then the complex is exact in all degrees and remains exact on applying the functor $\mathrm{Hom}_{\mathcal{O}_{\mathcal{D}}}(\mathcal{G}, -)$ for any $\mathcal{O}_{\mathcal{D}}$ -module \mathcal{G} .

Proof. To construct the complex, by the Yoneda lemma, it suffices for any $\mathcal{O}_{\mathcal{D}}$ -modules \mathcal{G} on \mathcal{D} to construct a complex

$$0 \rightarrow \mathrm{Hom}_{\mathcal{O}_{\mathcal{D}}}(\mathcal{G}, a_*\mathcal{F}) \rightarrow \mathrm{Hom}_{\mathcal{O}_{\mathcal{D}}}(\mathcal{G}, a_{0,*}\mathcal{F}_0) \rightarrow \mathrm{Hom}_{\mathcal{O}_{\mathcal{D}}}(\mathcal{G}, a_{1,*}\mathcal{F}_1) \rightarrow \dots$$

functorially in \mathcal{G} . To do this apply $\mathrm{Hom}_{\mathcal{O}}(-, \mathcal{F})$ to the exact complex of Lemma 11.2 and use adjointness of pullback and pushforward. The exactness properties in degrees $-1, 0$ follow from the construction as $\mathrm{Hom}_{\mathcal{O}}(-, \mathcal{F})$ is left exact. If \mathcal{F} is an injective \mathcal{O} -module, then the complex is exact because $\mathrm{Hom}_{\mathcal{O}}(-, \mathcal{F})$ is exact. \square

0D7F **Lemma 11.4.** *With notation as above for any K in $D^+(\mathcal{O})$ there is a spectral sequence $(E_r, d_r)_{r \geq 0}$ in $\mathrm{Mod}(\mathcal{O}_{\mathcal{D}})$ with*

$$E_1^{p,q} = R^q a_{p,*} K_p$$

converging to $R^{p+q} a_* K$. This spectral sequence is functorial in K .

Proof. Let \mathcal{I}^\bullet be a bounded below complex of injective \mathcal{O} -modules representing K . Consider the double complex with terms

$$A^{p,q} = a_{p,*} \mathcal{I}_p^q$$

where the horizontal arrows come from Lemma 11.3 and the vertical arrows from the differentials of the complex \mathcal{I}^\bullet . The lemma says rows of the double complex are exact in positive degrees and evaluate to $a_* \mathcal{I}^q$ in degree 0. Thus the total complex associated to the double complex computes $Ra_* K$ by Homology, Lemma 22.7. On the other hand, since restriction to \mathcal{C}_p is exact (Lemma 3.5) the complex \mathcal{I}_p^\bullet represents K_p in $D(\mathcal{C}_p)$. The sheaves \mathcal{I}_p^q are limg on \mathcal{C}_p (Lemma 6.2). Hence the cohomology of the columns are the sheaves $R^q a_{p,*} K_p$ by Leray's acyclicity lemma (Derived Categories, Lemma 17.7) and Cohomology on Sites, Lemma 15.3. We conclude by applying Homology, Lemma 22.6. \square

12. Cartesian sheaves and modules

0D7G Here is the definition.

07TF **Definition 12.1.** In Situation 3.3.

- (1) A sheaf \mathcal{F} of sets or of abelian groups on \mathcal{C} is *cartesian* if the maps $\mathcal{F}(\varphi) : f_\varphi^{-1} \mathcal{F}_m \rightarrow \mathcal{F}_n$ are isomorphisms for all $\varphi : [m] \rightarrow [n]$.

- (2) If \mathcal{O} is a sheaf of rings on \mathcal{C}_{total} , then a sheaf \mathcal{F} of \mathcal{O} -modules is *cartesian* if the maps $f_\varphi^* \mathcal{F}_m \rightarrow \mathcal{F}_n$ are isomorphisms for all $\varphi : [m] \rightarrow [n]$.
- (3) An object K of $D(\mathcal{C}_{total})$ is *cartesian* if the maps $f_\varphi^{-1} K_m \rightarrow K_n$ are isomorphisms for all $\varphi : [m] \rightarrow [n]$.
- (4) If \mathcal{O} is a sheaf of rings on \mathcal{C}_{total} , then an object K of $D(\mathcal{O})$ is *cartesian* if the maps $Lf_\varphi^* K_m \rightarrow K_n$ are isomorphisms for all $\varphi : [m] \rightarrow [n]$.

Of course there is a general notion of a cartesian section of a fibred category and the above are merely examples of this. The property on pullbacks needs only be checked for the degeneracies.

07TG **Lemma 12.2.** *In Situation 3.3.*

- (1) A sheaf \mathcal{F} of sets or abelian groups is cartesian if and only if the maps $(f_{\delta_j^n}^{-1}) \mathcal{F}_{n-1} \rightarrow \mathcal{F}_n$ are isomorphisms.
- (2) An object K of $D(\mathcal{C}_{total})$ is cartesian if and only if the maps $(f_{\delta_j^n}^{-1}) K_{n-1} \rightarrow K_n$ are isomorphisms.
- (3) If \mathcal{O} is a sheaf of rings on \mathcal{C}_{total} a sheaf \mathcal{F} of \mathcal{O} -modules is cartesian if and only if the maps $(f_{\delta_j^n}^*) \mathcal{F}_{n-1} \rightarrow \mathcal{F}_n$ are isomorphisms.
- (4) If \mathcal{O} is a sheaf of rings on \mathcal{C}_{total} an object K of $D(\mathcal{O})$ is cartesian if and only if the maps $L(f_{\delta_j^n}^*) K_{n-1} \rightarrow K_n$ are isomorphisms.
- (5) Add more here.

Proof. In each case the key is that the pullback functors compose to pullback functor; for part (4) see Cohomology on Sites, Lemma 19.3. We show how the argument works in case (1) and omit the proof in the other cases. The category Δ is generated by the morphisms the morphisms δ_j^n and σ_j^n , see Simplicial, Lemma 2.2. Hence we only need to check the maps $(f_{\delta_j^n}^{-1}) \mathcal{F}_{n-1} \rightarrow \mathcal{F}_n$ and $(f_{\sigma_j^n}^{-1}) \mathcal{F}_{n+1} \rightarrow \mathcal{F}_n$ are isomorphisms, see Simplicial, Lemma 3.2 for notation. Since $\sigma_j^n \circ \delta_j^{n+1} = \text{id}_{[n]}$ the composition

$$\mathcal{F}_n = (f_{\sigma_j^n}^{-1}) (f_{\delta_j^{n+1}}^{-1}) \mathcal{F}_n \rightarrow (f_{\sigma_j^n}^{-1}) \mathcal{F}_{n+1} \rightarrow \mathcal{F}_n$$

is the identity. Thus the result for δ_j^{n+1} implies the result for σ_j^n . \square

0D7H **Lemma 12.3.** *In Situation 3.3 let a_0 be an augmentation towards a site \mathcal{D} as in Remark 4.1.*

- (1) The pullback $a^{-1} \mathcal{G}$ of a sheaf of sets or abelian groups on \mathcal{D} is cartesian.
- (2) The pullback $a^{-1} K$ of an object K of $D(\mathcal{D})$ is cartesian.

Let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} and $\mathcal{O}_{\mathcal{D}}$ a sheaf of rings on \mathcal{D} and $a^\# : \mathcal{O}_{\mathcal{D}} \rightarrow a_* \mathcal{O}$ a morphism as in Section 11.

- (3) The pullback $a^* \mathcal{F}$ of a sheaf of $\mathcal{O}_{\mathcal{D}}$ -modules is cartesian.
- (4) The derived pullback $La^* K$ of an object K of $D(\mathcal{O}_{\mathcal{D}})$ is cartesian.

Proof. This follows immediately from the identities $a_m \circ f_\varphi = a_n$ for all $\varphi : [m] \rightarrow [n]$. See Lemma 4.2 and the discussion in Section 11. \square

0D7I **Lemma 12.4.** *In Situation 3.3. The category of cartesian sheaves of sets (resp. abelian groups) is equivalent to the category of pairs (\mathcal{F}, α) where \mathcal{F} is a sheaf of sets (resp. abelian groups) on \mathcal{C}_0 and*

$$\alpha : (f_{\delta_1^1}^{-1}) \mathcal{F} \longrightarrow (f_{\delta_0^1}^{-1}) \mathcal{F}$$

is an isomorphism of sheaves of sets (resp. abelian groups) on \mathcal{C}_1 such that $(f_{\delta_1^2})^{-1}\alpha = (f_{\delta_0^2})^{-1}\alpha \circ (f_{\delta_2^2})^{-1}\alpha$ as maps of sheaves on \mathcal{C}_2 .

Proof. We abbreviate $d_j^n = f_{\delta_j^n} : Sh(\mathcal{C}_n) \rightarrow Sh(\mathcal{C}_{n-1})$. The condition on α in the statement of the lemma makes sense because

$$d_1^1 \circ d_2^2 = d_1^1 \circ d_1^2, \quad d_1^1 \circ d_0^2 = d_0^1 \circ d_2^2, \quad d_0^1 \circ d_0^2 = d_0^1 \circ d_1^2$$

as morphisms of topoi $Sh(\mathcal{C}_2) \rightarrow Sh(\mathcal{C}_0)$, see Simplicial, Remark 3.3. Hence we can picture these maps as follows

$$\begin{array}{ccccc}
 & & (d_0^2)^{-1}(d_1^1)^{-1}\mathcal{F} & \xrightarrow{(d_0^2)^{-1}\alpha} & (d_0^2)^{-1}(d_0^1)^{-1}\mathcal{F} & & \\
 & & // & & // & & \\
 (d_2^2)^{-1}(d_0^1)^{-1}\mathcal{F} & & & & & & (d_1^2)^{-1}(d_0^1)^{-1}\mathcal{F} \\
 & \swarrow (d_2^2)^{-1}\alpha & & & & \searrow (d_1^2)^{-1}\alpha & \\
 & & (d_2^2)^{-1}(d_1^1)^{-1}\mathcal{F} & = & (d_1^2)^{-1}(d_1^1)^{-1}\mathcal{F} & &
 \end{array}$$

and the condition signifies the diagram is commutative. It is clear that given a cartesian sheaf \mathcal{G} of sets (resp. abelian groups) on \mathcal{C}_{total} we can set $\mathcal{F} = \mathcal{G}_0$ and α equal to the composition

$$(d_1^1)^{-1}\mathcal{G}_0 \rightarrow \mathcal{G}_1 \leftarrow (d_1^0)^{-1}\mathcal{G}_0$$

where the arrows are invertible as \mathcal{G} is cartesian. To prove this functor is an equivalence we construct a quasi-inverse. The construction of the quasi-inverse is analogous to the construction discussed in Descent, Section 3 from which we borrow the notation $\tau_i^n : [0] \rightarrow [n]$, $0 \mapsto i$ and $\tau_{ij}^n : [1] \rightarrow [n]$, $0 \mapsto i$, $1 \mapsto j$. Namely, given a pair (\mathcal{F}, α) as in the lemma we set $\mathcal{G}_n = (f_{\tau_n^n})^{-1}\mathcal{F}$. Given $\varphi : [n] \rightarrow [m]$ we define $\mathcal{G}(\varphi) : (f_\varphi)^{-1}\mathcal{G}_n \rightarrow \mathcal{G}_m$ using

$$\begin{array}{ccccccc}
 (f_\varphi)^{-1}\mathcal{G}_n & = & (f_\varphi)^{-1}(f_{\tau_n^n})^{-1}\mathcal{F} & = & (f_{\tau_{\varphi(n)}^m})^{-1}\mathcal{F} & = & (f_{\tau_{\varphi(n)m}^m})^{-1}(d_1^1)^{-1}\mathcal{F} \\
 & & & & & & \downarrow (f_{\tau_{\varphi(n)m}^m})^{-1}\alpha \\
 \mathcal{G}_m & = & (f_{\tau_m^m})^{-1}\mathcal{F} & = & (f_{\tau_{\varphi(n)m}^m})^{-1}(d_0^1)^{-1}\mathcal{F} & &
 \end{array}$$

We omit the verification that the commutativity of the displayed diagram above implies the maps compose correctly and hence give rise to a sheaf on \mathcal{C}_{total} , see Lemma 3.4. We also omit the verification that the two functors are quasi-inverse to each other. \square

07TH **Lemma 12.5.** *In Situation 3.3 let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} . The category of cartesian \mathcal{O} -modules is equivalent to the category of pairs (\mathcal{F}, α) where \mathcal{F} is a \mathcal{O}_0 -module and*

$$\alpha : (f_{\delta_1^1})^*\mathcal{F} \longrightarrow (f_{\delta_0^1})^*\mathcal{F}$$

is an isomorphism of \mathcal{O}_1 -modules such that $(f_{\delta_1^2})^\alpha = (f_{\delta_0^2})^*\alpha \circ (f_{\delta_2^2})^*\alpha$ as \mathcal{O}_2 -module maps.*

Proof. The proof is identical to the proof of Lemma 12.4 with pullback of sheaves of abelian groups replaced by pullback of modules. \square

0D7J **Lemma 12.6.** *In Situation 3.3.*

- (1) *The full subcategory of cartesian abelian sheaves forms a weak Serre subcategory of $Ab(\mathcal{C}_{total})$. Colimits of systems of cartesian abelian sheaves are cartesian.*
- (2) *Let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} such that the morphisms*

$$f_{\delta_j^n} : (Sh(\mathcal{C}_n), \mathcal{O}_n) \rightarrow (Sh(\mathcal{C}_{n-1}), \mathcal{O}_{n-1})$$

are flat. The full subcategory of cartesian \mathcal{O} -modules forms a weak Serre subcategory of $Mod(\mathcal{O})$. Colimits of systems of cartesian \mathcal{O} -modules are cartesian.

Proof. To see we obtain a weak Serre subcategory in (1) we check the conditions listed in Homology, Lemma 9.3. First, if $\varphi : \mathcal{F} \rightarrow \mathcal{G}$ is a map between cartesian abelian sheaves, then $\text{Ker}(\varphi)$ and $\text{Coker}(\varphi)$ are cartesian too because the restriction functors $Sh(\mathcal{C}_{total}) \rightarrow Sh(\mathcal{C}_n)$ and the functors f_φ^{-1} are exact. Similarly, if

$$0 \rightarrow \mathcal{F} \rightarrow \mathcal{H} \rightarrow \mathcal{G} \rightarrow 0$$

is a short exact sequence of abelian sheaves on \mathcal{C}_{total} with \mathcal{F} and \mathcal{G} cartesian, then it follows that \mathcal{H} is cartesian from the 5-lemma. To see the property of colimits, use that colimits commute with pullback as pullback is a left adjoint. In the case of modules we argue in the same manner, using the exactness of flat pullback (Modules on Sites, Lemma 30.2) and the fact that it suffices to check the condition for $f_{\delta_j^n}$, see Lemma 12.2. \square

0D7K **Remark 12.7** (Warning). Lemma 12.6 notwithstanding, it can happen that the category of cartesian \mathcal{O} -modules is abelian without being a Serre subcategory of $Mod(\mathcal{O})$. Namely, suppose that we only know that $f_{\delta_1^1}$ and $f_{\delta_0^1}$ are flat. Then it follows easily from Lemma 12.5 that the category of cartesian \mathcal{O} -modules is abelian. But if $f_{\delta_0^2}$ is not flat (for example), there is no reason for the inclusion functor from the category of cartesian \mathcal{O} -modules to all \mathcal{O} -modules to be exact.

0D7L **Lemma 12.8.** *In Situation 3.3.*

- (1) *An object K of $D(\mathcal{C}_{total})$ is cartesian if and only if $H^q(K)$ is a cartesian abelian sheaf for all q .*
- (2) *Let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} such that the morphisms $f_{\delta_j^n} : (Sh(\mathcal{C}_n), \mathcal{O}_n) \rightarrow (Sh(\mathcal{C}_{n-1}), \mathcal{O}_{n-1})$ are flat. Then an object K of $D(\mathcal{O})$ is cartesian if and only if $H^q(K)$ is a cartesian \mathcal{O} -module for all q .*

Proof. Part (1) is true because the pullback functors $(f_\varphi)^{-1}$ are exact. Part (2) follows from the characterization in Lemma 12.2 and the fact that $L(f_{\delta_j^n})^* = (f_{\delta_j^n})^*$ by flatness. \square

0D9E **Lemma 12.9.** *In Situation 3.3.*

- (1) *An object K of $D(\mathcal{C}_{total})$ is cartesian if and only the canonical map*

$$g_n! K_n \longrightarrow g_n! \mathbf{Z} \otimes_{\mathbf{Z}}^{\mathbf{L}} K$$

is an isomorphism for all n .

- (2) *Let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} such that the morphisms $f_\varphi^{-1} \mathcal{O}_n \rightarrow \mathcal{O}_m$ are flat for all $\varphi : [n] \rightarrow [m]$. Then an object K of $D(\mathcal{O})$ is cartesian if and only the canonical map*

$$g_n! K_n \longrightarrow g_n! \mathcal{O}_n \otimes_{\mathcal{O}}^{\mathbf{L}} K$$

is an isomorphism for all n .

Proof. Proof of (1). Since $g_{n!}$ is exact, it induces a functor on derived categories adjoint to g_n^{-1} . The map is the adjoint of the map $K_n \rightarrow (g_n^{-1}g_{n!}\mathbf{Z}) \otimes_{\mathbf{Z}}^{\mathbf{L}} K_n$ corresponding to $\mathbf{Z} \rightarrow g_n^{-1}g_{n!}\mathbf{Z}$ which in turn is adjoint to $\text{id} : g_{n!}\mathbf{Z} \rightarrow g_{n!}\mathbf{Z}$. Using the description of $g_{n!}$ given in Lemma 3.5 we see that the restriction to \mathcal{C}_m of this map is

$$\bigoplus_{\varphi:[n] \rightarrow [m]} f_{\varphi}^{-1} K_n \longrightarrow \bigoplus_{\varphi:[n] \rightarrow [m]} K_m$$

Thus the statement is clear.

Proof of (2). Since $g_{n!}$ is exact (Lemma 6.3), it induces a functor on derived categories adjoint to g_n^* (also exact). The map is the adjoint of the map $K_n \rightarrow (g_n^*g_{n!}\mathcal{O}_n) \otimes_{\mathcal{O}_n}^{\mathbf{L}} K_n$ corresponding to $\mathcal{O}_n \rightarrow g_n^*g_{n!}\mathcal{O}_n$ which in turn is adjoint to $\text{id} : g_{n!}\mathcal{O}_n \rightarrow g_{n!}\mathcal{O}_n$. Using the description of $g_{n!}$ given in Lemma 6.1 we see that the restriction to \mathcal{C}_m of this map is

$$\bigoplus_{\varphi:[n] \rightarrow [m]} f_{\varphi}^* K_n \longrightarrow \bigoplus_{\varphi:[n] \rightarrow [m]} f_{\varphi}^* \mathcal{O}_n \otimes_{\mathcal{O}_m} K_m = \bigoplus_{\varphi:[n] \rightarrow [m]} K_m$$

Thus the statement is clear. \square

0D7M **Lemma 12.10.** *In Situation 3.3 let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} . Let \mathcal{F} be a sheaf of \mathcal{O} -modules. Then \mathcal{F} is quasi-coherent in the sense of Modules on Sites, Definition 23.1 if and only if \mathcal{F} is cartesian and \mathcal{F}_n is a quasi-coherent \mathcal{O}_n -module for all n .*

Proof. Assume \mathcal{F} is quasi-coherent. Since pullbacks of quasi-coherent modules are quasi-coherent (Modules on Sites, Lemma 23.4) we see that \mathcal{F}_n is a quasi-coherent \mathcal{O}_n -module for all n . To show that \mathcal{F} is cartesian, let U be an object of \mathcal{C}_n for some n . Let us view U as an object of \mathcal{C}_{total} . Because \mathcal{F} is quasi-coherent there exists a covering $\{U_i \rightarrow U\}$ and for each i a presentation

$$\bigoplus_{j \in J_i} \mathcal{O}_{\mathcal{C}_{total}/U_i} \rightarrow \bigoplus_{k \in K_i} \mathcal{O}_{\mathcal{C}_{total}/U_i} \rightarrow \mathcal{F}|_{\mathcal{C}_{total}/U_i} \rightarrow 0$$

Observe that $\{U_i \rightarrow U\}$ is a covering of \mathcal{C}_n by the construction of the site \mathcal{C}_{total} . Next, let V be an object of \mathcal{C}_m for some m and let $V \rightarrow U$ be a morphism of \mathcal{C}_{total} lying over $\varphi : [n] \rightarrow [m]$. The fibre products $V_i = V \times_U U_i$ exist and we get an induced covering $\{V_i \rightarrow V\}$ in \mathcal{C}_m . Restricting the presentation above to the sites \mathcal{C}_n/U_i and \mathcal{C}_m/V_i we obtain presentations

$$\bigoplus_{j \in J_i} \mathcal{O}_{\mathcal{C}_m/U_i} \rightarrow \bigoplus_{k \in K_i} \mathcal{O}_{\mathcal{C}_m/U_i} \rightarrow \mathcal{F}_n|_{\mathcal{C}_n/U_i} \rightarrow 0$$

and

$$\bigoplus_{j \in J_i} \mathcal{O}_{\mathcal{C}_m/V_i} \rightarrow \bigoplus_{k \in K_i} \mathcal{O}_{\mathcal{C}_m/V_i} \rightarrow \mathcal{F}_m|_{\mathcal{C}_m/V_i} \rightarrow 0$$

These presentations are compatible with the map $\mathcal{F}(\varphi) : f_{\varphi}^* \mathcal{F}_n \rightarrow \mathcal{F}_m$ (as this map is defined using the restriction maps of \mathcal{F} along morphisms of \mathcal{C}_{total} lying over φ). We conclude that $\mathcal{F}(\varphi)|_{\mathcal{C}_m/V_i}$ is an isomorphism. As $\{V_i \rightarrow V\}$ is a covering we conclude $\mathcal{F}(\varphi)|_{\mathcal{C}_m/V}$ is an isomorphism. Since V and U were arbitrary this proves that \mathcal{F} is cartesian. (In case A use Sites, Lemma 14.9.)

Conversely, assume \mathcal{F}_n is quasi-coherent for all n and that \mathcal{F} is cartesian. Then for any n and object U of \mathcal{C}_n we can choose a covering $\{U_i \rightarrow U\}$ of \mathcal{C}_n and for each i a presentation

$$\bigoplus_{j \in J_i} \mathcal{O}_{\mathcal{C}_m/U_i} \rightarrow \bigoplus_{k \in K_i} \mathcal{O}_{\mathcal{C}_m/U_i} \rightarrow \mathcal{F}_n|_{\mathcal{C}_n/U_i} \rightarrow 0$$

Pulling back to \mathcal{C}_{total}/U_i we obtain complexes

$$\bigoplus_{j \in J_i} \mathcal{O}_{\mathcal{C}_{total}/U_i} \rightarrow \bigoplus_{k \in K_i} \mathcal{O}_{\mathcal{C}_{total}/U_i} \rightarrow \mathcal{F}|_{\mathcal{C}_{total}/U_i} \rightarrow 0$$

of modules on \mathcal{C}_{total}/U_i . Then the property that \mathcal{F} is cartesian implies that this is exact. We omit the details. \square

13. Formalities on cohomological descent

0D7N In this section we discuss only to what extent a morphism of ringed topoi determines an embedding from the derived category downstairs to the derived category upstairs. Here is a typical result.

0D7Q **Lemma 13.1.** *Let $f : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi. Consider the full subcategory $D' \subset D(\mathcal{O}_{\mathcal{D}})$ consisting of objects K such that*

$$K \longrightarrow Rf_* Lf^* K$$

is an isomorphism. Then D' is a saturated triangulated strictly full subcategory of $D(\mathcal{O}_{\mathcal{D}})$ and the functor $Lf^ : D' \rightarrow D(\mathcal{O}_{\mathcal{C}})$ is fully faithful.*

Proof. See Derived Categories, Definition 6.1 for the definition of saturated in this setting. See Derived Categories, Lemma 4.15 for a discussion of triangulated subcategories. The canonical map of the lemma is the unit of the adjoint pair of functors (Lf^*, Rf_*) , see Cohomology on Sites, Lemma 20.1. Having said this the proof that D' is a saturated triangulated subcategory is omitted; it follows formally from the fact that Lf^* and Rf_* are exact functors of triangulated categories. The final part follows formally from fact that Lf^* and Rf_* are adjoint; compare with Categories, Lemma 24.3. \square

0D7R **Lemma 13.2.** *Let $f : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi. Consider the full subcategory $D' \subset D(\mathcal{O}_{\mathcal{C}})$ consisting of objects K such that*

$$Lf^* Rf_* K \longrightarrow K$$

is an isomorphism. Then D' is a saturated triangulated strictly full subcategory of $D(\mathcal{O}_{\mathcal{C}})$ and the functor $Rf_ : D' \rightarrow D(\mathcal{O}_{\mathcal{D}})$ is fully faithful.*

Proof. See Derived Categories, Definition 6.1 for the definition of saturated in this setting. See Derived Categories, Lemma 4.15 for a discussion of triangulated subcategories. The canonical map of the lemma is the counit of the adjoint pair of functors (Lf^*, Rf_*) , see Cohomology on Sites, Lemma 20.1. Having said this the proof that D' is a saturated triangulated subcategory is omitted; it follows formally from the fact that Lf^* and Rf_* are exact functors of triangulated categories. The final part follows formally from fact that Lf^* and Rf_* are adjoint; compare with Categories, Lemma 24.3. \square

0D7S **Lemma 13.3.** *Let $f : (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ be a morphism of ringed topoi. Let K be an object of $D(\mathcal{O}_{\mathcal{C}})$. Assume*

- (1) *f is flat,*
- (2) *K is bounded below,*
- (3) *$f^* Rf_* H^q(K) \rightarrow H^q(K)$ is an isomorphism.*

Then $f^ Rf_* K \rightarrow K$ is an isomorphism.*

Proof. Observe that $f^*Rf_*K \rightarrow K$ is an isomorphism if and only if it is an isomorphism on cohomology sheaves H^j . Observe that $H^j(f^*Rf_*K) = f^*H^j(Rf_*K) = f^*H^j(Rf_*\tau_{\leq j}K) = H^j(f^*Rf_*\tau_{\leq j}K)$. Hence we may assume that K is bounded. Then property (3) tells us the cohomology sheaves are in the triangulated subcategory $D' \subset D(\mathcal{O}_C)$ of Lemma 13.2. Hence K is in it too. \square

0D7T **Lemma 13.4.** *Let $f : (Sh(\mathcal{C}), \mathcal{O}_C) \rightarrow (Sh(\mathcal{D}), \mathcal{O}_D)$ be a morphism of ringed topoi. Let K be an object of $D(\mathcal{O}_D)$. Assume*

- (1) f is flat,
- (2) K is bounded below,
- (3) $H^q(K) \rightarrow Rf_*f^*H^q(K)$ is an isomorphism.

*Then $K \rightarrow Rf_*f^*K$ is an isomorphism.*

Proof. Observe that $K \rightarrow Rf_*f^*K$ is an isomorphism if and only if it is an isomorphism on cohomology sheaves H^j . Observe that $H^j(Rf_*f^*K) = H^j(Rf_*\tau_{\leq j}f^*K) = H^j(Rf_*f^*\tau_{\leq j}K)$. Hence we may assume that K is bounded. Then property (3) tells us the cohomology sheaves are in the triangulated subcategory $D' \subset D(\mathcal{O}_D)$ of Lemma 13.1. Hence K is in it too. \square

0D7U **Lemma 13.5.** *Let $f : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{C}'), \mathcal{O}')$ be a morphism of ringed topoi. Let $\mathcal{A} \subset Mod(\mathcal{O})$ and $\mathcal{A}' \subset Mod(\mathcal{O}')$ be weak Serre subcategories. Assume*

- (1) f is flat,
- (2) f^* induces an equivalence of categories $\mathcal{A}' \rightarrow \mathcal{A}$,
- (3) $\mathcal{F}' \rightarrow Rf_*f^*\mathcal{F}'$ is an isomorphism for $\mathcal{F}' \in Ob(\mathcal{A}')$.

Then $f^ : D_{\mathcal{A}'}^+(\mathcal{O}') \rightarrow D_{\mathcal{A}}^+(\mathcal{O})$ is an equivalence of categories with quasi-inverse given by $Rf_* : D_{\mathcal{A}}^+(\mathcal{O}) \rightarrow D_{\mathcal{A}'}^+(\mathcal{O}')$.*

Proof. By assumptions (2) and (3) and Lemmas 13.3 and 13.1 we see that $f^* : D_{\mathcal{A}'}^+(\mathcal{O}') \rightarrow D_{\mathcal{A}}^+(\mathcal{O})$ is fully faithful. Let $\mathcal{F} \in Ob(\mathcal{A})$. Then we can write $\mathcal{F} = f^*\mathcal{F}'$. Then $Rf_*\mathcal{F} = Rf_*f^*\mathcal{F}' = \mathcal{F}'$. In particular, we have $R^p f_*\mathcal{F} = 0$ for $p > 0$ and $f_*\mathcal{F} \in Ob(\mathcal{A}')$. Thus for any $K \in D_{\mathcal{A}}^+(\mathcal{O})$ we see, using the spectral sequence $E_2^{p,q} = R^p f_*H^q(K)$ converging to $R^{p+q}f_*K$, that Rf_*K is in $D_{\mathcal{A}'}^+(\mathcal{O}')$. Of course, it also follows from Lemmas 13.4 and 13.2 that $Rf_* : D_{\mathcal{A}}^+(\mathcal{O}) \rightarrow D_{\mathcal{A}'}^+(\mathcal{O}')$ is fully faithful. Since f^* and Rf_* are adjoint we then get the result of the lemma, for example by Categories, Lemma 24.3. \square

0D7V **Lemma 13.6.** *Let $f : (Sh(\mathcal{C}), \mathcal{O}) \rightarrow (Sh(\mathcal{C}'), \mathcal{O}')$ be a morphism of ringed topoi. Let $\mathcal{A} \subset Mod(\mathcal{O})$ and $\mathcal{A}' \subset Mod(\mathcal{O}')$ be weak Serre subcategories. Assume*

- (1) f is flat,
- (2) f^* induces an equivalence of categories $\mathcal{A}' \rightarrow \mathcal{A}$,
- (3) $\mathcal{F}' \rightarrow Rf_*f^*\mathcal{F}'$ is an isomorphism for $\mathcal{F}' \in Ob(\mathcal{A}')$,
- (4) $\mathcal{C}, \mathcal{O}, \mathcal{A}$ satisfy the assumption of Cohomology on Sites, Situation 24.1,
- (5) $\mathcal{C}', \mathcal{O}', \mathcal{A}'$ satisfy the assumption of Cohomology on Sites, Situation 24.1.

Then $f^ : D_{\mathcal{A}'}(\mathcal{O}') \rightarrow D_{\mathcal{A}}(\mathcal{O})$ is an equivalence of categories with quasi-inverse given by $Rf_* : D_{\mathcal{A}}(\mathcal{O}) \rightarrow D_{\mathcal{A}'}(\mathcal{O}')$.*

Proof. Since f^* is exact, it is clear that f^* defines a functor $f^* : D_{\mathcal{A}'}(\mathcal{O}') \rightarrow D_{\mathcal{A}}(\mathcal{O})$ as in the statement of the lemma and that moreover this functor commutes with the truncation functors $\tau_{\geq -n}$. We already know that f^* and Rf_* are quasi-inverse equivalence on the corresponding bounded below categories, see Lemma

This is analogous to [LO08, Theorem 2.2.3].

13.5. By Cohomology on Sites, Lemma 24.4 with $N = 0$ we see that Rf_* indeed defines a functor $Rf_* : D_{\mathcal{A}}(\mathcal{O}) \rightarrow D_{\mathcal{A}'}(\mathcal{O}')$ and that moreover this functor commutes with the truncation functors $\tau_{\geq -n}$. Thus for K in $D_{\mathcal{A}}(\mathcal{O})$ the map $f^*Rf_*K \rightarrow K$ is an isomorphism as this is true on truncations. Similarly, for K' in $D_{\mathcal{A}'}(\mathcal{O}')$ the map $K' \rightarrow Rf_*f^*K'$ is an isomorphism as this is true on truncations. This finishes the proof. \square

0D7W **Lemma 13.7.** *Let $f : (\mathcal{C}, \mathcal{O}) \rightarrow (\mathcal{C}', \mathcal{O}')$ be a morphism of ringed sites. Let $\mathcal{A} \subset \text{Mod}(\mathcal{O})$ and $\mathcal{A}' \subset \text{Mod}(\mathcal{O}')$ be weak Serre subcategories. Assume*

- (1) f is flat,
- (2) f^* induces an equivalence of categories $\mathcal{A}' \rightarrow \mathcal{A}$,
- (3) $\mathcal{F}' \rightarrow Rf_*f^*\mathcal{F}'$ is an isomorphism for $\mathcal{F}' \in \text{Ob}(\mathcal{A}')$,
- (4) $\mathcal{C}, \mathcal{O}, \mathcal{A}$ satisfy the assumption of Cohomology on Sites, Situation 24.1,
- (5) $f : (\mathcal{C}, \mathcal{O}) \rightarrow (\mathcal{C}', \mathcal{O}')$ and \mathcal{A} satisfy the assumption of Cohomology on Sites, Situation 24.5.

Then $f^* : D_{\mathcal{A}'}(\mathcal{O}') \rightarrow D_{\mathcal{A}}(\mathcal{O})$ is an equivalence of categories with quasi-inverse given by $Rf_* : D_{\mathcal{A}}(\mathcal{O}) \rightarrow D_{\mathcal{A}'}(\mathcal{O}')$.

Proof. The proof of this lemma is exactly the same as the proof of Lemma 13.6 except the reference to Cohomology on Sites, Lemma 24.4 is replaced by a reference to Cohomology on Sites, Lemma 24.6. \square

Let \mathcal{C} be a category. Let $\text{Cov}(\mathcal{C}) \supset \text{Cov}'(\mathcal{C})$ be two ways to endow \mathcal{C} with the structure of a site. Denote τ the topology corresponding to $\text{Cov}(\mathcal{C})$ and τ' the topology corresponding to $\text{Cov}'(\mathcal{C})$. Then the identity functor on \mathcal{C} defines a morphism of sites

$$\epsilon : \mathcal{C}_{\tau} \longrightarrow \mathcal{C}_{\tau'}$$

where ϵ_* is the identity functor on underlying presheaves and where ϵ^{-1} is the τ -sheafification of a τ' -sheaf (hence clearly exact). Let \mathcal{O} be a sheaf of rings for the τ -topology. Then \mathcal{O} is also a sheaf for the τ' -topology and ϵ becomes a morphism of ringed sites

$$\epsilon : (\mathcal{C}_{\tau}, \mathcal{O}_{\tau}) \longrightarrow (\mathcal{C}_{\tau'}, \mathcal{O}_{\tau'})$$

07A8 **Lemma 13.8.** *With $\epsilon : (\mathcal{C}_{\tau}, \mathcal{O}_{\tau}) \rightarrow (\mathcal{C}_{\tau'}, \mathcal{O}_{\tau'})$ as above. Let $\mathcal{B} \subset \text{Ob}(\mathcal{C})$ be a subset. Let $\mathcal{A} \subset \text{PMod}(\mathcal{O})$ be a full subcategory. Assume*

- (1) every object of \mathcal{A} is a sheaf for the τ -topology,
- (2) \mathcal{A} is a weak Serre subcategory of $\text{Mod}(\mathcal{O}_{\tau})$,
- (3) every object of \mathcal{C} has a τ' -covering whose members are elements of \mathcal{B} , and
- (4) for every $U \in \mathcal{B}$ we have $H_{\tau'}^p(U, \mathcal{F}) = 0$, $p > 0$ for all $\mathcal{F} \in \mathcal{A}$.

Then \mathcal{A} is a weak Serre subcategory of $\text{Mod}(\mathcal{O}_{\tau'})$ and there is an equivalence of triangulated categories $D_{\mathcal{A}}(\mathcal{O}_{\tau}) = D_{\mathcal{A}}(\mathcal{O}_{\tau'})$ given by ϵ^* and $R\epsilon_*$.

Proof. Since $\epsilon^{-1}\mathcal{O}_{\tau'} = \mathcal{O}_{\tau}$ we see that ϵ is a flat morphism of ringed sites and that in fact $\epsilon^{-1} = \epsilon^*$ on sheaves of modules. By property (1) we can think of every object of \mathcal{A} as a sheaf of \mathcal{O}_{τ} -modules and as a sheaf of $\mathcal{O}_{\tau'}$ -modules. In other words, we have fully faithful inclusion functors

$$\mathcal{A} \rightarrow \text{Mod}(\mathcal{O}_{\tau}) \rightarrow \text{Mod}(\mathcal{O}_{\tau'})$$

To avoid confusion we will denote $\mathcal{A}' \subset \text{Mod}(\mathcal{O}_{\tau'})$ the image of \mathcal{A} . Then it is clear that $\epsilon_* : \mathcal{A} \rightarrow \mathcal{A}'$ and $\epsilon^* : \mathcal{A}' \rightarrow \mathcal{A}$ are quasi-inverse equivalences (see discussion preceding the lemma and use that objects of \mathcal{A}' are sheaves in the τ topology).

This is analogous to [LO08, Theorem 2.2.3].

Conditions (3) and (4) imply that $R^p\epsilon_*\mathcal{F} = 0$ for $p > 0$ and $\mathcal{F} \in \text{Ob}(\mathcal{A})$. This is true because $R^p\epsilon_*$ is the sheaf associated to the presheave $U \mapsto H_\tau^p(U, \mathcal{F})$, see Cohomology on Sites, Lemma 8.4. Thus any exact complex in \mathcal{A} (which is the same thing as an exact complex in $\text{Mod}(\mathcal{O}_\tau)$ whose terms are in \mathcal{A} , see Homology, Lemma 9.3) remains exact upon applying the functor ϵ_* .

Consider an exact sequence

$$\mathcal{F}'_0 \rightarrow \mathcal{F}'_1 \rightarrow \mathcal{F}'_2 \rightarrow \mathcal{F}'_3 \rightarrow \mathcal{F}'_4$$

in $\text{Mod}(\mathcal{O}_{\tau'})$ with $\mathcal{F}'_0, \mathcal{F}'_1, \mathcal{F}'_3, \mathcal{F}'_4$ in \mathcal{A}' . Apply the exact functor ϵ^* to get an exact sequence

$$\epsilon^*\mathcal{F}'_0 \rightarrow \epsilon^*\mathcal{F}'_1 \rightarrow \epsilon^*\mathcal{F}'_2 \rightarrow \epsilon^*\mathcal{F}'_3 \rightarrow \epsilon^*\mathcal{F}'_4$$

in $\text{Mod}(\mathcal{O}_\tau)$. Since \mathcal{A} is a weak Serre subcategory and since $\epsilon^*\mathcal{F}'_0, \epsilon^*\mathcal{F}'_1, \epsilon^*\mathcal{F}'_3, \epsilon^*\mathcal{F}'_4$ are in \mathcal{A} , we conclude that $\epsilon^*\mathcal{F}'_2$ is in \mathcal{A} by Homology, Definition 9.1. Consider the map of sequences

$$\begin{array}{ccccccccc} \mathcal{F}'_0 & \longrightarrow & \mathcal{F}'_1 & \longrightarrow & \mathcal{F}'_2 & \longrightarrow & \mathcal{F}'_3 & \longrightarrow & \mathcal{F}'_4 \\ \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\ \epsilon_*\epsilon^*\mathcal{F}'_0 & \longrightarrow & \epsilon_*\epsilon^*\mathcal{F}'_1 & \longrightarrow & \epsilon_*\epsilon^*\mathcal{F}'_2 & \longrightarrow & \epsilon_*\epsilon^*\mathcal{F}'_3 & \longrightarrow & \epsilon_*\epsilon^*\mathcal{F}'_4 \end{array}$$

The lower row is exact by the discussion in the preceding paragraph. The vertical arrows with index 0, 1, 3, 4 are isomorphisms by the discussion in the first paragraph. By the 5 lemma (Homology, Lemma 5.20) we find that $\mathcal{F}'_2 \cong \epsilon_*\epsilon^*\mathcal{F}'_2$ and hence \mathcal{F}'_2 is in \mathcal{A}' . In this way we see that \mathcal{A}' is a weak Serre subcategory of $\text{Mod}(\mathcal{O}_{\tau'})$, see Homology, Definition 9.1.

At this point it makes sense to talk about the derived categories $D_{\mathcal{A}}(\mathcal{O}_\tau)$ and $D_{\mathcal{A}'}(\mathcal{O}_{\tau'})$, see Derived Categories, Section 13. To finish the proof we show that conditions (1) – (5) of Lemma 13.7 apply. We have already seen (1), (2), (3) above. Note that since every object has a τ' -covering by objects of \mathcal{B} , a fortiori every object has a τ -covering by objects of \mathcal{B} . Hence condition (4) of Lemma 13.7 is satisfied. Similarly, condition (5) is satisfied as well. \square

14. Simplicial systems of the derived category

0D9F In this section we are going to prove a special case of [BBD82, Proposition 3.2.9] in the setting of derived categories of abelian sheaves. The case of modules is discussed in Section 15.

0D9G **Definition 14.1.** In Situation 3.3. A *simplicial system of the derived category* consists of the following data

- (1) for every n an object K_n of $D(\mathcal{C}_n)$,
- (2) for every $\varphi : [m] \rightarrow [n]$ a map $K_\varphi : f_\varphi^{-1}K_m \rightarrow K_n$ in $D(\mathcal{C}_n)$

subject to the condition that

$$K_{\varphi \circ \psi} = K_\varphi \circ f_\varphi^{-1}K_\psi : f_{\varphi \circ \psi}^{-1}K_l = f_\varphi^{-1}f_\psi^{-1}K_l \longrightarrow K_n$$

for any morphisms $\varphi : [m] \rightarrow [n]$ and $\psi : [l] \rightarrow [m]$ of Δ . We say the simplicial system is *cartesian* if the maps K_φ are isomorphisms for all φ . Given two simplicial systems of the derived category there is an obvious notion of a *morphism of simplicial systems of the derived category*.

We have given this notion a ridiculously long name intentionally. The goal is to show that a simplicial system of the derived category comes from an object of $D(\mathcal{C}_{total})$ under certain hypotheses.

0D9H **Lemma 14.2.** *In Situation 3.3. If $K \in D(\mathcal{C}_{total})$ is an object, then $(K_n, K(\varphi))$ is a simplicial system of the derived category. If K is cartesian, so is the system.*

Proof. This is obvious. \square

0D9I **Lemma 14.3.** *In Situation 3.3. Let K be an object of $D(\mathcal{C}_{total})$. Set*

$$X_n = (g_n! \mathbf{Z}) \otimes_{\mathbf{Z}}^{\mathbf{L}} K \quad \text{and} \quad Y_n = (g_n! \mathbf{Z} \rightarrow \dots \rightarrow g_0! \mathbf{Z})[-n] \otimes_{\mathbf{Z}}^{\mathbf{L}} K$$

as objects of $D(\mathcal{C}_{total})$ where the maps are as in Lemma 8.1. With the evident canonical maps $Y_n \rightarrow X_n$ and $Y_0 \rightarrow Y_1[1] \rightarrow Y_2[2] \rightarrow \dots$ we have

- (1) the distinguished triangles $Y_n \rightarrow X_n \rightarrow Y_{n-1} \rightarrow Y_n[1]$ define a Postnikov system (Derived Categories, Definition 37.1) for $\dots \rightarrow X_2 \rightarrow X_1 \rightarrow X_0$,
- (2) $K = \text{hocolim} Y_n[n]$ in $D(\mathcal{C}_{total})$.

Proof. First, if $K = \mathbf{Z}$, then this is the construction of Derived Categories, Example 37.2 applied to the complex

$$\dots \rightarrow g_2! \mathbf{Z} \rightarrow g_1! \mathbf{Z} \rightarrow g_0! \mathbf{Z}$$

in $Ab(\mathcal{C}_{total})$ combined with the fact that this complex represents $K = \mathbf{Z}$ in $D(\mathcal{C}_{total})$ by Lemma 8.1. The general case follows from this, the fact that the exact functor $-\otimes_{\mathbf{Z}}^{\mathbf{L}} K$ sends Postnikov systems to Postnikov systems, and that $-\otimes_{\mathbf{Z}}^{\mathbf{L}} K$ commutes with homotopy colimits. \square

0D9J **Lemma 14.4.** *In Situation 3.3. If $K, K' \in D(\mathcal{C}_{total})$. Assume*

- (1) K is cartesian,
- (2) $\text{Hom}(K_i[i], K'_i) = 0$ for $i > 0$, and
- (3) $\text{Hom}(K_i[i+1], K'_i) = 0$ for $i \geq 0$.

Then any map $K \rightarrow K'$ which induces the zero map $K_0 \rightarrow K'_0$ is zero.

Proof. Consider the objects X_n and the Postnikov system Y_n associated to K in Lemma 14.3. As $K = \text{hocolim} Y_n[n]$ the map $K \rightarrow K'$ induces a compatible family of morphisms $Y_n[n] \rightarrow K'$. By (1) and Lemma 12.9 we have $X_n = g_n! K_n$. Since $Y_0 = X_0$ we find that $K_0 \rightarrow K'_0$ being zero implies $Y_0 \rightarrow K'$ is zero. Suppose we've shown that the map $Y_n[n] \rightarrow K'$ is zero for some $n \geq 0$. From the distinguished triangle

$$Y_n[n] \rightarrow Y_{n+1}[n+1] \rightarrow X_{n+1}[n+1] \rightarrow Y_n[n+1]$$

we get an exact sequence

$$\text{Hom}(X_{n+1}[n+1], K') \rightarrow \text{Hom}(Y_{n+1}[n+1], K') \rightarrow \text{Hom}(Y_n[n], K')$$

As $X_{n+1}[n+1] = g_{n+1}! K_{n+1}[n+1]$ the first group is equal to

$$\text{Hom}(K_{n+1}[n+1], K'_{n+1})$$

which is zero by assumption (2). By induction we conclude all the maps $Y_n[n] \rightarrow K'$ are zero. Consider the defining distinguished triangle

$$\bigoplus Y_n[n] \rightarrow \bigoplus Y_n[n] \rightarrow K \rightarrow (\bigoplus Y_n[n])[1]$$

for the homotopy colimit. Arguing as above, we find that it suffices to show that

$$\text{Hom}((\bigoplus Y_n[n])[1], K') = \prod \text{Hom}(Y_n[n+1], K')$$

is zero for all $n \geq 0$. To see this, arguing as above, it suffices to show that

$$\mathrm{Hom}(K_n[n+1], K'_n) = 0$$

for all $n \geq 0$ which follows from condition (3). \square

0D9K **Lemma 14.5.** *In Situation 3.3. If $K, K' \in D(\mathcal{C}_{total})$. Assume*

- (1) K is cartesian,
- (2) $\mathrm{Hom}(K_i[i-1], K'_i) = 0$ for $i > 1$.

Then any map $\{K_n \rightarrow K'_n\}$ between the associated simplicial systems of K and K' comes from a map $K \rightarrow K'$ in $D(\mathcal{C}_{total})$.

Proof. Let $\{K_n \rightarrow K'_n\}_{n \geq 0}$ be a morphism of simplicial systems of the derived category. Consider the objects X_n and Postnikov system Y_n associated to K of Lemma 14.3. By (1) and Lemma 12.9 we have $X_n = g_n!K_n$. In particular, the map $K_0 \rightarrow K'_0$ induces a morphism $X_0 \rightarrow K'$. Since $\{K_n \rightarrow K'_n\}$ is a morphism of systems, a computation (omitted) shows that the composition

$$X_1 \rightarrow X_0 \rightarrow K'$$

is zero. As $Y_0 = X_0$ and as Y_1 fits into a distinguished triangle

$$Y_1 \rightarrow X_1 \rightarrow Y_0 \rightarrow Y_1[1]$$

we conclude that there exists a morphism $Y_1[1] \rightarrow K'$ whose composition with $X_0 = Y_0 \rightarrow Y_1[1]$ is the morphism $X_0 \rightarrow K'$ given above. Suppose given a map $Y_n[n] \rightarrow K'$ for $n \geq 1$. From the distinguished triangle

$$X_{n+1}[n] \rightarrow Y_n[n] \rightarrow Y_{n+1}[n+1] \rightarrow X_{n+1}[n+1]$$

we get an exact sequence

$$\mathrm{Hom}(Y_{n+1}[n+1], K') \rightarrow \mathrm{Hom}(Y_n[n], K') \rightarrow \mathrm{Hom}(X_{n+1}[n], K')$$

As $X_{n+1}[n] = g_{n+1}!K_{n+1}[n]$ the last group is equal to

$$\mathrm{Hom}(K_{n+1}[n], K'_{n+1})$$

which is zero by assumption (2). By induction we get a system of maps $Y_n[n] \rightarrow K'$ compatible with transition maps and reducing to the given map on Y_0 . This produces a map

$$\gamma : K = \mathrm{hocolim} Y_n[n] \longrightarrow K'$$

This map in any case has the property that the diagram

$$\begin{array}{ccc} X_0 & \longrightarrow & K \\ & \searrow & \downarrow \gamma \\ & & K' \end{array}$$

is commutative. Restricting to \mathcal{C}_0 we deduce that the map $\gamma_0 : K_0 \rightarrow K'_0$ is the same as the first map $K_0 \rightarrow K'_0$ of the morphism of simplicial systems. Since K is cartesian, this easily gives that $\{\gamma_n\}$ is the map of simplicial systems we started out with. \square

0D9L **Lemma 14.6.** *In Situation 3.3. Let (K_n, K_φ) be a simplicial system of the derived category. Assume*

- (1) (K_n, K_φ) is cartesian,
- (2) $\mathrm{Hom}(K_i[t], K_i) = 0$ for $i \geq 0$ and $t > 0$.

Then there exists a cartesian object K of $D(\mathcal{C}_{total})$ whose associated simplicial system is isomorphic to (K_n, K_φ) .

Proof. Set $X_n = g_n!K_n$ in $D(\mathcal{C}_{total})$. For each $n \geq 1$ we have

$$\mathrm{Hom}(X_n, X_{n-1}) = \mathrm{Hom}(K_n, g_n^{-1}g_{n-1}!K_{n-1}) = \bigoplus_{\varphi: [n-1] \rightarrow [n]} \mathrm{Hom}(K_n, f_\varphi^{-1}K_{n-1})$$

Thus we get a map $X_n \rightarrow X_{n-1}$ corresponding to the alternating sum of the maps $K_\varphi^{-1} : K_n \rightarrow f_\varphi^{-1}K_{n-1}$ where φ runs over $\delta_0^n, \dots, \delta_n^n$. We can do this because K_φ is invertible by assumption (1). Please observe the similarity with the definition of the maps in the proof of Lemma 8.1. We obtain a complex

$$\dots \rightarrow X_2 \rightarrow X_1 \rightarrow X_0$$

in $D(\mathcal{C}_{total})$. We omit the computation which shows that the compositions are zero. By Derived Categories, Lemma 37.5 if we have

$$\mathrm{Hom}(X_i[i-j-2], X_j) = 0 \text{ for } i > j+2$$

then we can extend this complex to a Postnikov system. The group is equal to

$$\mathrm{Hom}(K_i[i-j-2], g_i^{-1}g_j!K_j)$$

Again using that (K_n, K_φ) is cartesian we see that $g_i^{-1}g_j!K_j$ is isomorphic to a finite direct sum of copies of K_i . Hence the group vanishes by assumption (2). Let the Postnikov system be given by $Y_0 = X_0$ and distinguished sequences $Y_n \rightarrow X_n \rightarrow Y_{n-1} \rightarrow Y_n[1]$ for $n \geq 1$. We set

$$K = \mathrm{hocolim} Y_n[n]$$

To finish the proof we have to show that $g_m^{-1}K$ is isomorphic to K_m for all m compatible with the maps K_φ . Observe that

$$g_m^{-1}K = \mathrm{hocolim} g_m^{-1}Y_n[n]$$

and that $g_m^{-1}Y_n[n]$ is a Postnikov system for $g_m^{-1}X_n$. Consider the isomorphisms

$$g_m^{-1}X_n = \bigoplus_{\varphi: [n] \rightarrow [m]} f_\varphi^{-1}K_n \xrightarrow{\bigoplus K_\varphi} \bigoplus_{\varphi: [n] \rightarrow [m]} K_m$$

These maps define an isomorphism of complexes

$$\begin{array}{ccccccc} \dots & \longrightarrow & g_m^{-1}X_2 & \longrightarrow & g_m^{-1}X_1 & \longrightarrow & g_m^{-1}X_0 \\ & & \downarrow & & \downarrow & & \downarrow \\ \dots & \longrightarrow & \bigoplus_{\varphi: [2] \rightarrow [m]} K_m & \longrightarrow & \bigoplus_{\varphi: [1] \rightarrow [m]} K_m & \longrightarrow & \bigoplus_{\varphi: [0] \rightarrow [m]} K_m \end{array}$$

in $D(\mathcal{C}_m)$ where the arrows in the bottom row are as in the proof of Lemma 8.1. The squares commute by our choice of the arrows of the complex $\dots \rightarrow X_2 \rightarrow X_1 \rightarrow X_0$; we omit the computation. The bottom row complex has a postnikov tower given by

$$Y'_{m,n} = \left(\bigoplus_{\varphi: [n] \rightarrow [m]} \mathbf{Z} \rightarrow \dots \rightarrow \bigoplus_{\varphi: [0] \rightarrow [m]} \mathbf{Z} \right) [-n] \otimes_{\mathbf{Z}}^{\mathbf{L}} K_m$$

and $\mathrm{hocolim} Y'_{m,n} = K_m$ (please compare with the proof of Lemma 14.3 and Derived Categories, Example 37.2). Applying the second part of Derived Categories, Lemma

37.5 the vertical maps in the big diagram extend to an isomorphism of Postnikov systems provided we have

$$\mathrm{Hom}(g_m^{-1}X_i[i-j-1], \bigoplus_{\varphi:[j] \rightarrow [m]} K_m) = 0 \text{ for } i > j+1$$

This is true if $\mathrm{Hom}(K_m[i-j-1], K_m) = 0$ for $i > j+1$ which holds by assumption (2). Choose an isomorphism given by $\gamma_{m,n} : g_m^{-1}Y_n \rightarrow Y'_{m,n}$ of Postnikov systems in $D(\mathcal{C}_m)$. By uniqueness of homotopy colimits, we can find an isomorphism

$$g_m^{-1}K = \mathrm{hocolim} g_m^{-1}Y_n[n] \xrightarrow{\gamma_m} \mathrm{hocolim} Y'_{m,n} = K_m$$

compatible with $\gamma_{m,n}$.

We still have to prove that the maps γ_m fit into commutative diagrams

$$\begin{array}{ccc} f_\varphi^{-1}g_m^{-1}K & \xrightarrow{K(\varphi)} & g_n^{-1}K \\ f_\varphi^{-1}\gamma_m \downarrow & & \downarrow \gamma_n \\ f_\varphi^{-1}K_m & \xrightarrow{K_\varphi} & K_n \end{array}$$

for every $\varphi : [m] \rightarrow [n]$. Consider the diagram

$$\begin{array}{ccccc} f_\varphi^{-1}(\bigoplus_{\psi:[0] \rightarrow [m]} f_\psi^{-1}K_0) & \xlongequal{\quad} & f_\varphi^{-1}g_m^{-1}X_0 & \xrightarrow{X_0(\varphi)} & g_n^{-1}X_0 & \xlongequal{\quad} & \bigoplus_{\chi:[0] \rightarrow [n]} f_\chi^{-1}K_0 \\ f_\varphi^{-1}(\bigoplus K_\psi) \downarrow & & \downarrow & & \downarrow & & \downarrow \bigoplus K_\chi \\ f_\varphi^{-1}(\bigoplus_{\psi:[0] \rightarrow [m]} K_m) & & f_\varphi^{-1}g_m^{-1}K & \xrightarrow{K(\varphi)} & g_n^{-1}K & & \bigoplus_{\chi:[0] \rightarrow [n]} K_n \\ \parallel & & f_\varphi^{-1}\gamma_m \downarrow & & \downarrow \gamma_n & & \parallel \\ f_\varphi^{-1}Y'_{0,m} & \xrightarrow{\quad} & f_\varphi^{-1}K_m & \xrightarrow{K_\varphi} & K_n & \xleftarrow{\quad} & Y'_{0,n} \end{array}$$

The top middle square is commutative as $X_0 \rightarrow K$ is a morphism of simplicial objects. The left, resp. the right rectangles are commutative as γ_m , resp. γ_n is compatible with $\gamma_{0,m}$, resp. $\gamma_{0,n}$ which are the arrows $\bigoplus K_\psi$ and $\bigoplus K_\chi$ in the diagram. Going around the outer rectangle of the diagram is commutative as (K_n, K_φ) is a simplicial system and the map $X_0(\varphi)$ is given by the obvious identifications $f_\varphi^{-1}f_\psi^{-1}K_0 = f_{\varphi \circ \psi}^{-1}K_0$. Note that the arrow $\bigoplus_{\psi} K_m \rightarrow Y'_{0,m} \rightarrow K_m$ induces an isomorphism on any of the direct summands (because of our explicit construction of the Postnikov systems $Y'_{i,j}$ above). Hence, if we take a direct summand of the upper left and corner, then this maps isomorphically to $f_\varphi^{-1}g_m^{-1}K$ as γ_m is an isomorphism. Working out what the above says, but looking only at this direct summand we conclude the lower middle square commutes as we well. This concludes the proof. \square

15. Simplicial systems of the derived category: modules

0D9M In this section we are going to prove a special case of [BBD82, Proposition 3.2.9] in the setting of derived categories of \mathcal{O} -modules. The (slightly) easier case of abelian sheaves is discussed in Section 14.

0D9N **Definition 15.1.** In Situation 3.3. Let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} . A *simplicial system of the derived category of modules* consists of the following data

- (1) for every n an object K_n of $D(\mathcal{O}_n)$,

(2) for every $\varphi : [m] \rightarrow [n]$ a map $K_\varphi : Lf_\varphi^* K_m \rightarrow K_n$ in $D(\mathcal{O}_n)$ subject to the condition that

$$K_{\varphi \circ \psi} = K_\varphi \circ Lf_\varphi^* K_\psi : Lf_{\varphi \circ \psi}^* K_l = Lf_\varphi^* Lf_\psi^* K_l \longrightarrow K_n$$

for any morphisms $\varphi : [m] \rightarrow [n]$ and $\psi : [l] \rightarrow [m]$ of Δ . We say the simplicial system is *cartesian* if the maps K_φ are isomorphisms for all φ . Given two simplicial systems of the derived category there is an obvious notion of a *morphism of simplicial systems of the derived category of modules*.

We have given this notion a ridiculously long name intentionally. The goal is to show that a simplicial system of the derived category of modules comes from an object of $D(\mathcal{O})$ under certain hypotheses.

0D9P **Lemma 15.2.** *In Situation 3.3 let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} . If $K \in D(\mathcal{O})$ is an object, then $(K_n, K(\varphi))$ is a simplicial system of the derived category of modules. If K is cartesian, so is the system.*

Proof. This is immediate from the definitions. \square

0D9Q **Lemma 15.3.** *In Situation 3.3 let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} . Let K be an object of $D(\mathcal{C}_{total})$. Set*

$$X_n = (g_n! \mathcal{O}_n) \otimes_{\mathcal{O}}^{\mathbf{L}} K \quad \text{and} \quad Y_n = (g_n! \mathcal{O}_n \rightarrow \dots \rightarrow g_0! \mathcal{O}_0)[-n] \otimes_{\mathcal{O}}^{\mathbf{L}} K$$

as objects of $D(\mathcal{O})$ where the maps are as in Lemma 8.1. With the evident canonical maps $Y_n \rightarrow X_n$ and $Y_0 \rightarrow Y_1[1] \rightarrow Y_2[2] \rightarrow \dots$ we have

- (1) the distinguished triangles $Y_n \rightarrow X_n \rightarrow Y_{n-1} \rightarrow Y_n[1]$ define a Postnikov system (Derived Categories, Definition 37.1) for $\dots \rightarrow X_2 \rightarrow X_1 \rightarrow X_0$,
- (2) $K = \text{hocolim} Y_n[n]$ in $D(\mathcal{O})$.

Proof. First, if $K = \mathcal{O}$, then this is the construction of Derived Categories, Example 37.2 applied to the complex

$$\dots \rightarrow g_2! \mathcal{O}_2 \rightarrow g_1! \mathcal{O}_1 \rightarrow g_0! \mathcal{O}_0$$

in $Ab(\mathcal{C}_{total})$ combined with the fact that this complex represents $K = \mathcal{O}$ in $D(\mathcal{C}_{total})$ by Lemma 10.1. The general case follows from this, the fact that the exact functor $-\otimes_{\mathcal{O}}^{\mathbf{L}} K$ sends Postnikov systems to Postnikov systems, and that $-\otimes_{\mathcal{O}}^{\mathbf{L}} K$ commutes with homotopy colimits. \square

0D9R **Lemma 15.4.** *In Situation 3.3 let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} . If $K, K' \in D(\mathcal{O})$. Assume*

- (1) $f_\varphi^{-1} \mathcal{O}_n \rightarrow \mathcal{O}_m$ is flat for $\varphi : [m] \rightarrow [n]$,
- (2) K is cartesian,
- (3) $\text{Hom}(K_i[i], K'_i) = 0$ for $i > 0$, and
- (4) $\text{Hom}(K_i[i+1], K'_i) = 0$ for $i \geq 0$.

Then any map $K \rightarrow K'$ which induces the zero map $K_0 \rightarrow K'_0$ is zero.

Proof. The proof is exactly the same as the proof of Lemma 14.4 except using Lemma 15.3 instead of Lemma 14.3. \square

0D9S **Lemma 15.5.** *In Situation 3.3 let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} . If $K, K' \in D(\mathcal{O})$. Assume*

- (1) $f_\varphi^{-1} \mathcal{O}_n \rightarrow \mathcal{O}_m$ is flat for $\varphi : [m] \rightarrow [n]$,

- (2) K is cartesian,
- (3) $\text{Hom}(K_i[i-1], K'_i) = 0$ for $i > 1$.

Then any map $\{K_n \rightarrow K'_n\}$ between the associated simplicial systems of K and K' comes from a map $K \rightarrow K'$ in $D(\mathcal{O})$.

Proof. The proof is exactly the same as the proof of Lemma 14.5 except using Lemma 15.3 instead of Lemma 14.3. \square

0D9T **Lemma 15.6.** *In Situation 3.3 let \mathcal{O} be a sheaf of rings on \mathcal{C}_{total} . Let (K_n, K_φ) be a simplicial system of the derived category of modules. Assume*

- (1) $f_\varphi^{-1}\mathcal{O}_n \rightarrow \mathcal{O}_m$ is flat for $\varphi : [m] \rightarrow [n]$,
- (2) (K_n, K_φ) is cartesian,
- (3) $\text{Hom}(K_i[t], K_i) = 0$ for $i \geq 0$ and $t > 0$.

Then there exists a cartesian object K of $D(\mathcal{O})$ whose associated simplicial system is isomorphic to (K_n, K_φ) .

Proof. The proof is exactly the same as the proof of Lemma 14.6 with the following changes

- (1) use $g_n^* = Lg_n^*$ everywhere instead of g_n^{-1} ,
- (2) use $f_\varphi^* = Lf_\varphi^*$ everywhere instead of f_φ^{-1} ,
- (3) refer to Lemma 10.1 instead of Lemma 8.1,
- (4) in the construction of $Y'_{m,n}$ use \mathcal{O}_m instead of \mathbf{Z} ,
- (5) compare with the proof of Lemma 15.3 rather than the proof of Lemma 14.3.

This ends the proof. \square

16. The site associated to a semi-representable object

09WK Let \mathcal{C} be a site. Recall that a *semi-representable object* of \mathcal{C} is simply a family $\{U_i\}_{i \in I}$ of objects of \mathcal{C} . A *morphism* $\{U_i\}_{i \in I} \rightarrow \{V_j\}_{j \in J}$ of *semi-representable objects* is given by a map $\alpha : I \rightarrow J$ and for every $i \in I$ a morphism $f_i : U_i \rightarrow V_{\alpha(i)}$ of \mathcal{C} . The category of semi-representable objects of \mathcal{C} is denoted $\text{SR}(\mathcal{C})$. See Hypercoverings, Definition 2.1 and the enclosing section for more information.

For a semi-representable object $K = \{U_i\}_{i \in I}$ of \mathcal{C} we let

$$\mathcal{C}/K = \coprod_{i \in I} \mathcal{C}/U_i$$

be the disjoint union of the localizations of \mathcal{C} at U_i . There is a natural structure of a site on this category, with coverings inherited from the localizations \mathcal{C}/U_i . The site \mathcal{C}/K is called the *localization of \mathcal{C} at K* . Observe that a sheaf on \mathcal{C}/K is the same thing as a family of sheaves \mathcal{F}_i on \mathcal{C}/U_i , i.e.,

$$\text{Sh}(\mathcal{C}/K) = \prod_{i \in I} \text{Sh}(\mathcal{C}/U_i)$$

This is occasionally useful to understand what is going on.

Let \mathcal{C} be a site. Let $K = \{U_i\}_{i \in I}$ be an object of $\text{SR}(\mathcal{C})$. There is a continuous and cocontinuous localization functor $j : \mathcal{C}/K \rightarrow \mathcal{C}$ which is the product of the localization functors $j_i : \mathcal{C}/U_i \rightarrow \mathcal{C}$. We obtain functors $j_!$, j^{-1} , j_* exactly as in

Sites, Section 24. In terms of the product decomposition $Sh(\mathcal{C}/K) = \prod_{i \in I} Sh(\mathcal{C}/U_i)$ we have

$$\begin{aligned} j! & : (\mathcal{F}_i)_{i \in I} \longmapsto \prod j_{i,!} \mathcal{F}_i \\ j^{-1} & : \mathcal{G} \longmapsto (j_i^{-1} \mathcal{G})_{i \in I} \\ j_* & : (\mathcal{F}_i)_{i \in I} \longmapsto \prod j_{i,*} \mathcal{F}_i \end{aligned}$$

as the reader easily verifies.

Let $f : K \rightarrow L$ be a morphism of $SR(\mathcal{C})$. Then we obtain a continuous and cocontinuous functor

$$v : \mathcal{C}/K \longrightarrow \mathcal{C}/L$$

by applying the construction of Sites, Lemma 24.8 to the components. More precisely, suppose $f = (\alpha, f_i)$ where $K = \{U_i\}_{i \in I}$, $L = \{V_j\}_{j \in J}$, $\alpha : I \rightarrow J$, and $f_i : U_i \rightarrow V_{\alpha(i)}$. Then the functor v maps the component \mathcal{C}/U_i into the component $\mathcal{C}/V_{\alpha(i)}$ via the construction of the aforementioned lemma. In particular we obtain a morphism

$$f : Sh(\mathcal{C}/K) \rightarrow Sh(\mathcal{C}/L)$$

of topoi. In terms of the product decompositions $Sh(\mathcal{C}/K) = \prod_{i \in I} Sh(\mathcal{C}/U_i)$ and $Sh(\mathcal{C}/L) = \prod_{j \in J} Sh(\mathcal{C}/V_j)$ the reader verifies that

$$\begin{aligned} f! & : (\mathcal{F}_i)_{i \in I} \longmapsto (\prod_{i \in I, \alpha(i)=j} f_{i,!} \mathcal{F}_i)_{j \in J} \\ f^{-1} & : (\mathcal{G}_j)_{j \in J} \longmapsto (f_i^{-1} \mathcal{G}_{\alpha(i)})_{i \in I} \\ f_* & : (\mathcal{F}_i)_{i \in I} \longmapsto (\prod_{i \in I, \alpha(i)=j} f_{i,*} \mathcal{F}_i)_{j \in J} \end{aligned}$$

where $f_i : Sh(\mathcal{C}/U_i) \rightarrow Sh(\mathcal{C}/V_{\alpha(i)})$ is the morphism associated to the localization functor $\mathcal{C}/U_i \rightarrow \mathcal{C}/V_{\alpha(i)}$ corresponding to $f_i : U_i \rightarrow V_{\alpha(i)}$.

0D85 **Lemma 16.1.** *Let \mathcal{C} be a site.*

- (1) *For K in $SR(\mathcal{C})$ the functor $j : \mathcal{C}/K \rightarrow \mathcal{C}$ is continuous, cocontinuous, and has property P of Sites, Remark 19.5.*
- (2) *For $f : K \rightarrow L$ in $SR(\mathcal{C})$ the functor $v : \mathcal{C}/K \rightarrow \mathcal{C}/L$ (see above) is continuous, cocontinuous, and has property P of Sites, Remark 19.5.*

Proof. Proof of (2). In the notation of the discussion preceding the lemma, the localization functors $\mathcal{C}/U_i \rightarrow \mathcal{C}/V_{\alpha(i)}$ are continuous and cocontinuous by Sites, Section 24 and satisfy P by Sites, Remark 24.11. It is formal to deduce v is continuous and cocontinuous and has P . We omit the details. We also omit the proof of (1). \square

0D86 **Lemma 16.2.** *Let \mathcal{C} be a site and K in $SR(\mathcal{C})$. For \mathcal{F} in $Sh(\mathcal{C})$ we have*

$$j_* j^{-1} \mathcal{F} = \mathcal{H}om(F(K)^\#, \mathcal{F})$$

where F is as in Hypercoverings, Definition 2.2.

Proof. Say $K = \{U_i\}_{i \in I}$. Using the description of the functors j^{-1} and j_* given above we see that

$$j_* j^{-1} \mathcal{F} = \prod_{i \in I} j_{i,*} (\mathcal{F}|_{\mathcal{C}/U_i}) = \prod_{i \in I} \mathcal{H}om(h_{U_i}^\#, \mathcal{F})$$

The second equality by Sites, Lemma 25.3. Since $F(K) = \coprod h_{U_i}$ in $PSh(\mathcal{C})$, we have $F(K)^\# = \coprod h_{U_i}^\#$ in $Sh(\mathcal{C})$ and since $\mathcal{H}om(-, \mathcal{F})$ turns coproducts into products (immediate from the construction in Sites, Section 25), we conclude. \square

0D87 **Lemma 16.3.** *Let \mathcal{C} be a site.*

- (1) For K in $SR(\mathcal{C})$ the functor $j_!$ gives an equivalence $Sh(\mathcal{C}/K) \rightarrow Sh(\mathcal{C})/F(K)^\#$ where F is as in Hypercoverings, Definition 2.2.
- (2) The functor $j^{-1} : Sh(\mathcal{C}) \rightarrow Sh(\mathcal{C}/K)$ corresponds via the identification of (1) with $\mathcal{F} \mapsto (\mathcal{F} \times F(K)^\# \rightarrow F(K)^\#)$.
- (3) For $f : K \rightarrow L$ in $SR(\mathcal{C})$ the functor f^{-1} corresponds via the identifications of (1) to the functor $Sh(\mathcal{C})/F(L)^\# \rightarrow Sh(\mathcal{C})/F(K)^\#$, $(\mathcal{G} \rightarrow F(L)^\#) \mapsto (\mathcal{G} \times_{F(L)^\#} F(K)^\# \rightarrow F(K)^\#)$.

Proof. Observe that if $K = \{U_i\}_{i \in I}$ then the category $Sh(\mathcal{C}/K)$ decomposes as the product of the categories $Sh(\mathcal{C}/U_i)$. Observe that $F(K)^\# = \coprod_{i \in I} h_{U_i}^\#$ (coproduct in sheaves). Hence $Sh(\mathcal{C})/F(K)^\#$ is the product of the categories $Sh(\mathcal{C})/h_{U_i}^\#$. Thus (1) and (2) follow from the corresponding statements for each i , see Sites, Lemmas 24.4 and 24.7. Similarly, if $L = \{V_j\}_{j \in J}$ and f is given by $\alpha : I \rightarrow J$ and $f_i : U_i \rightarrow V_{\alpha(i)}$, then we can apply Sites, Lemma 24.9 to each of the re-localization morphisms $\mathcal{C}/U_i \rightarrow \mathcal{C}/V_{\alpha(i)}$ to get (3). \square

0D88 **Lemma 16.4.** *Let \mathcal{C} be a site. For K in $SR(\mathcal{C})$ the functor j^{-1} sends injective abelian sheaves to injective abelian sheaves.*

Proof. This is the natural generalization of Cohomology on Sites, Lemma 8.1 to semi-representable objects. In fact, it follows from this lemma by the product decomposition of $Sh(\mathcal{C}/K)$ and the description of the functor j^{-1} given above. \square

0D89 **Remark 16.5** (Variant for over an object). Let \mathcal{C} be a site. Let $X \in \text{Ob}(\mathcal{C})$. The category $SR(\mathcal{C}, X)$ of *semi-representable objects over X* is defined by the formula $SR(\mathcal{C}, X) = SR(\mathcal{C}/X)$. See Hypercoverings, Definition 2.1. Thus we may apply the above discussion to the site \mathcal{C}/X . Briefly, the constructions above give

- (1) a site \mathcal{C}/K for K in $SR(\mathcal{C}, X)$,
- (2) a decomposition $Sh(\mathcal{C}/K) = \prod Sh(\mathcal{C}/U_i)$ if $K = \{U_i/X\}$,
- (3) a localization functor $j : \mathcal{C}/K \rightarrow \mathcal{C}/X$,
- (4) a morphism $f : Sh(\mathcal{C}/K) \rightarrow Sh(\mathcal{C}/L)$ for $f : K \rightarrow L$ in $SR(\mathcal{C}, X)$.

All results of this section hold in this situation by replacing \mathcal{C} everywhere by \mathcal{C}/X .

0D9U **Remark 16.6** (Ringed variant). Let \mathcal{C} be a site. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings on \mathcal{C} . In this case, for any semi-representable object K of \mathcal{C} the site \mathcal{C}/K is a ringed site with sheaf of rings $\mathcal{O}_K = j^{-1}\mathcal{O}_{\mathcal{C}}$. The constructions above give

- (1) a ringed site $(\mathcal{C}/K, \mathcal{O}_K)$ for K in $SR(\mathcal{C})$,
- (2) a decomposition $Mod(\mathcal{O}_K) = \prod Mod(\mathcal{O}_{U_i})$ if $K = \{U_i\}$,
- (3) a localization morphism $j : (Sh(\mathcal{C}/K), \mathcal{O}_K) \rightarrow (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}})$ of ringed topoi,
- (4) a morphism $f : (Sh(\mathcal{C}/K), \mathcal{O}_K) \rightarrow (Sh(\mathcal{C}/L), \mathcal{O}_L)$ of ringed topoi for $f : K \rightarrow L$ in $SR(\mathcal{C})$.

Many of the results above hold in this setting. For example, the functor j^* has an exact left adjoint

$$j_! : Mod(\mathcal{O}_K) \rightarrow Mod(\mathcal{O}_{\mathcal{C}}),$$

which in terms of the product decomposition given in (2) sends $(\mathcal{F}_i)_{i \in I}$ to $\bigoplus j_{i,!}\mathcal{F}_i$. Similarly, given $f : K \rightarrow L$ as above, the functor f^* has an exact left adjoint $f_! : Mod(\mathcal{O}_K) \rightarrow Mod(\mathcal{O}_L)$. Thus the functors j^* and f^* are exact, i.e., j and f are flat morphisms of ringed topoi (also follows from the equalities $\mathcal{O}_K = j^{-1}\mathcal{O}_{\mathcal{C}}$ and $\mathcal{O}_K = f^{-1}\mathcal{O}_L$).

0D9V **Remark 16.7** (Ringed variant over an object). Let \mathcal{C} be a site. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings on \mathcal{C} . Let $X \in \text{Ob}(\mathcal{C})$ and denote $\mathcal{O}_X = \mathcal{O}_{\mathcal{C}}|_{\mathcal{C}/U}$. Then we can combine the constructions given in Remarks 16.5 and 16.6 to get

- (1) a ringed site $(\mathcal{C}/K, \mathcal{O}_K)$ for K in $\text{SR}(\mathcal{C}, X)$,
- (2) a decomposition $\text{Mod}(\mathcal{O}_K) = \prod \text{Mod}(\mathcal{O}_{U_i})$ if $K = \{U_i\}$,
- (3) a localization morphism $j : (\text{Sh}(\mathcal{C}/K), \mathcal{O}_K) \rightarrow (\text{Sh}(\mathcal{C}/X), \mathcal{O}_X)$ of ringed topoi,
- (4) a morphism $f : (\text{Sh}(\mathcal{C}/K), \mathcal{O}_K) \rightarrow (\text{Sh}(\mathcal{C}/L), \mathcal{O}_L)$ of ringed topoi for $f : K \rightarrow L$ in $\text{SR}(\mathcal{C}, X)$.

Of course all of the results mentioned in Remark 16.6 hold in this setting as well.

17. The site associate to a simplicial semi-representable object

0D8A Let \mathcal{C} be a site. Let K be a simplicial object of $\text{SR}(\mathcal{C})$. As usual, set $K_n = K([n])$ and denote $K(\varphi) : K_n \rightarrow K_m$ the morphism associated to $\varphi : [m] \rightarrow [n]$. By the construction in Section 16 we obtain a simplicial object $n \mapsto \mathcal{C}/K_n$ in the category whose objects are sites and whose morphisms are cocontinuous functors. In other words, we get a gadget as in Case B of Section 3. The functors satisfy property P by Lemma 16.1. Hence we may apply Lemma 3.2 to obtain a site $(\mathcal{C}/K)_{total}$.

We can describe the site $(\mathcal{C}/K)_{total}$ explicitly as follows. Say $K_n = \{U_{n,i}\}_{i \in I_n}$. For $\varphi : [m] \rightarrow [n]$ the morphism $K(\varphi) : K_n \rightarrow K_m$ is given by a map $\alpha(\varphi) : I_n \rightarrow I_m$ and morphisms $f_{\varphi,i} : U_{n,i} \rightarrow U_{m,\alpha(\varphi)(i)}$ for $i \in I_n$. Then we have

- (1) an object of $(\mathcal{C}/K)_{total}$ corresponds to an object $(U/U_{n,i})$ of $\mathcal{C}/U_{n,i}$ for some n and some $i \in I_n$,
- (2) a morphism between $U/U_{n,i}$ and $V/U_{m,j}$ is a pair (φ, f) where $\varphi : [m] \rightarrow [n]$, $j = \alpha(\varphi)(i)$, and $f : U \rightarrow V$ is a morphism of \mathcal{C} such that

$$\begin{array}{ccc} U & \xrightarrow{\quad} & V \\ \downarrow & \searrow f & \downarrow \\ U_{n,i} & \xrightarrow{f_{\varphi,i}} & U_{m,j} \end{array}$$

is commutative, and

- (3) coverings of the object $U/U_{n,i}$ are constructed by starting with a covering $\{f_j : U_j \rightarrow U\}$ in \mathcal{C} and letting $\{(\text{id}, f_j) : U_j/U_{n,i} \rightarrow U/U_{n,i}\}$ be a covering in $(\mathcal{C}/K)_{total}$.

All of our general theory developed for simplicial sites applies to $(\mathcal{C}/K)_{total}$. Observe that the obvious forgetful functor

$$j_{total} : (\mathcal{C}/K)_{total} \longrightarrow \mathcal{C}$$

is continuous and cocontinuous. It turns out that the associated morphism of topoi comes from an (obvious) augmentation.

0D8B **Lemma 17.1.** *Let \mathcal{C} be a site. Let K be a simplicial object of $\text{SR}(\mathcal{C})$. The localization functor $j_0 : \mathcal{C}/K_0 \rightarrow \mathcal{C}$ defines an augmentation $a_0 : \text{Sh}(\mathcal{C}/K_0) \rightarrow \text{Sh}(\mathcal{C})$, as in case (B) of Remark 4.1. The corresponding morphisms of topoi*

$$a_n : \text{Sh}(\mathcal{C}/K_n) \longrightarrow \text{Sh}(\mathcal{C}), \quad a : \text{Sh}((\mathcal{C}/K)_{total}) \longrightarrow \text{Sh}(\mathcal{C})$$

of Lemma 4.2 are equal to the morphisms of topoi associated to the continuous and cocontinuous localization functors $j_n : \mathcal{C}/K_n \rightarrow \mathcal{C}$ and $j_{total} : (\mathcal{C}/K)_{total} \rightarrow \mathcal{C}$.

Proof. This is immediate from working through the definitions. See in particular the footnote in the proof of Lemma 4.2 for the relationship between a and j_{total} . \square

09WM **Lemma 17.2.** *With assumption and notation as in Lemma 17.1 we have the following properties:*

- (1) *there is a functor $a_1^{Sh} : Sh((\mathcal{C}/K)_{total}) \rightarrow Sh(\mathcal{C})$ left adjoint to $a^{-1} : Sh(\mathcal{C}) \rightarrow Sh((\mathcal{C}/K)_{total})$,*
- (2) *there is a functor $a_1 : Ab((\mathcal{C}/K)_{total}) \rightarrow Ab(\mathcal{C})$ left adjoint to $a^{-1} : Ab(\mathcal{C}) \rightarrow Ab((\mathcal{C}/K)_{total})$,*
- (3) *the functor a^{-1} associates to \mathcal{F} in $Sh(\mathcal{C})$ the sheaf on $(\mathcal{C}/K)_{total}$ with in degree n is equal to $a_n^{-1}\mathcal{F}$,*
- (4) *the functor a_* associates to \mathcal{G} in $Ab((\mathcal{C}/K)_{total})$ the equalizer of the two maps $j_{0,*}\mathcal{G}_0 \rightarrow j_{1,*}\mathcal{G}_1$,*

Proof. Parts (3) and (4) hold for any augmentation of a simplicial site, see Lemma 4.2. Parts (1) and (2) follow as j_{total} is continuous and cocontinuous. The functor a_1^{Sh} is constructed in Sites, Lemma 20.5 and the functor a_1 is constructed in Modules on Sites, Lemma 16.2. \square

0DC0 **Lemma 17.3.** *Let \mathcal{C} be a site. Let K be a simplicial object of $SR(\mathcal{C})$. Let $U/U_{n,i}$ be an object of \mathcal{C}/K_n . Let $\mathcal{F} \in Ab((\mathcal{C}/K)_{total})$. Then*

$$H^p(U, \mathcal{F}) = H^p(U, \mathcal{F}_{n,i})$$

where

- (1) *on the left hand side U is viewed as an object of \mathcal{C}_{total} , and*
- (2) *on the right hand side $\mathcal{F}_{n,i}$ is the i th component of the sheaf \mathcal{F}_n on \mathcal{C}/K_n in the decomposition $Sh(\mathcal{C}/K_n) = \coprod Sh(\mathcal{C}/U_{n,i})$ of Section 16.*

Proof. This follows immediately from Lemma 8.4 and the product decompositions of Section 16. \square

0D8C **Remark 17.4** (Variant for over an object). Let \mathcal{C} be a site. Let $X \in \text{Ob}(\mathcal{C})$. Recall that we have a category $SR(\mathcal{C}, X) = SR(\mathcal{C}/X)$ of semi-representable objects over X , see Remark 16.5. We may apply the above discussion to the site \mathcal{C}/X . Briefly, the constructions above give

- (1) a site $(\mathcal{C}/K)_{total}$ for a simplicial K object of $SR(\mathcal{C}, X)$,
- (2) a localization functor $j_{total} : (\mathcal{C}/K)_{total} \rightarrow \mathcal{C}/X$,
- (3) localization functors $j_n : \mathcal{C}/K_n \rightarrow \mathcal{C}/X$,
- (4) a morphism of topoi $a : Sh((\mathcal{C}/K)_{total}) \rightarrow Sh(\mathcal{C}/X)$,
- (5) morphisms of topoi $a_n : Sh(\mathcal{C}/K_n) \rightarrow Sh(\mathcal{C}/X)$,
- (6) a functor $a_1^{Sh} : Sh((\mathcal{C}/K)_{total}) \rightarrow Sh(\mathcal{C}/X)$ left adjoint to a^{-1} , and
- (7) a functor $a_1 : Ab((\mathcal{C}/K)_{total}) \rightarrow Ab(\mathcal{C}/X)$ left adjoint to a^{-1} .

All of the results of this section hold in this setting. To prove this one replaces the site \mathcal{C} everywhere by \mathcal{C}/X .

0D9W **Remark 17.5** (Ringed variant). Let \mathcal{C} be a site. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings. Given a simplicial semi-representable object K of \mathcal{C} we set $\mathcal{O} = a^{-1}\mathcal{O}_{\mathcal{C}}$, where a is as in Lemmas 17.1 and 17.2. The constructions above, keeping track of the sheaves of rings as in Remark 16.6, give

- (1) a ringed site $((\mathcal{C}/K)_{total}, \mathcal{O})$ for a simplicial K object of $SR(\mathcal{C})$,
- (2) a morphism of ringed topoi $a : (Sh((\mathcal{C}/K)_{total}), \mathcal{O}) \rightarrow (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}})$,

- (3) morphisms of ringed topoi $a_n : (Sh(\mathcal{C}/K_n), \mathcal{O}_n) \rightarrow (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}})$,
- (4) a functor $a_! : Mod(\mathcal{O}) \rightarrow Mod(\mathcal{O}_{\mathcal{C}})$ left adjoint to a^* .

The functor $a_!$ exists (but in general is not exact) because $a^{-1}\mathcal{O}_{\mathcal{C}} = \mathcal{O}$ and we can replace the use of Modules on Sites, Lemma 16.2 in the proof of Lemma 17.2 by Modules on Sites, Lemma 40.1. As discussed in Remark 16.6 there are exact functors $a_n! : Mod(\mathcal{O}_n) \rightarrow Mod(\mathcal{O}_{\mathcal{C}})$ left adjoint to a_n^* . Consequently, the morphisms a and a_n are flat. Remark 16.6 implies the morphism of ringed topoi $f_{\varphi} : (Sh(\mathcal{C}/K_n), \mathcal{O}_n) \rightarrow (Sh(\mathcal{C}/K_m), \mathcal{O}_m)$ for $\varphi : [m] \rightarrow [n]$ is flat and there exists an exact functor $f_{\varphi!} : Mod(\mathcal{O}_n) \rightarrow Mod(\mathcal{O}_m)$ left adjoint to f_{φ}^* . This in turn implies that for the flat morphism of ringed topoi $g_n : (Sh(\mathcal{C}/K_n), \mathcal{O}_n) \rightarrow (Sh((\mathcal{C}/K)_{total}), \mathcal{O})$ the functor $g_n! : Mod(\mathcal{O}_n) \rightarrow Mod(\mathcal{O})$ left adjoint to g_n^* is exact, see Lemma 6.3.

0D9X **Remark 17.6** (Ringed variant over an object). Let \mathcal{C} be a site. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings. Let $X \in \text{Ob}(\mathcal{C})$ and denote $\mathcal{O}_X = \mathcal{O}_{\mathcal{C}}|_{\mathcal{C}/X}$. Then we can combine the constructions given in Remarks 17.4 and 17.5 to get

- (1) a ringed site $((\mathcal{C}/K)_{total}, \mathcal{O})$ for a simplicial K object of $\text{SR}(\mathcal{C}, X)$,
- (2) a morphism of ringed topoi $a : (Sh((\mathcal{C}/K)_{total}), \mathcal{O}) \rightarrow (Sh(\mathcal{C}/X), \mathcal{O}_X)$,
- (3) morphisms of ringed topoi $a_n : (Sh(\mathcal{C}/K_n), \mathcal{O}_n) \rightarrow (Sh(\mathcal{C}/X), \mathcal{O}_X)$,
- (4) a functor $a_! : Mod(\mathcal{O}) \rightarrow Mod(\mathcal{O}_X)$ left adjoint to a^* .

Of course, all the results mentioned in Remark 17.5 hold in this setting as well.

18. Cohomological descent for hypercoverings

0D8D Let \mathcal{C} be a site. In this section we assume \mathcal{C} has equalizers and fibre products. We let K be a hypercovering as defined in Hypercoverings, Definition 6.1. We will study the augmentation

$$a : Sh((\mathcal{C}/K)_{total}) \longrightarrow Sh(\mathcal{C})$$

of Section 17.

0D8E **Lemma 18.1.** *Let \mathcal{C} be a site with equalizers and fibre products. Let K be a hypercovering. Then*

- (1) $a^{-1} : Sh(\mathcal{C}) \rightarrow Sh((\mathcal{C}/K)_{total})$ is fully faithful with essential image the cartesian sheaves of sets,
- (2) $a^{-1} : Ab(\mathcal{C}) \rightarrow Ab((\mathcal{C}/K)_{total})$ is fully faithful with essential image the cartesian sheaves of abelian groups.

In both cases a_ provides the quasi-inverse functor.*

Proof. The case of abelian sheaves follows immediately from the case of sheaves of sets as the functor a^{-1} commutes with products. In the rest of the proof we work with sheaves of sets. Observe that $a^{-1}\mathcal{F}$ is cartesian for \mathcal{F} in $Sh(\mathcal{C})$ by Lemma 12.3. It suffices to show that the adjunction map $\mathcal{F} \rightarrow a_*a^{-1}\mathcal{F}$ is an isomorphism \mathcal{F} in $Sh(\mathcal{C})$ and that for a cartesian sheaf \mathcal{G} on $(\mathcal{C}/K)_{total}$ the adjunction map $a^{-1}a_*\mathcal{G} \rightarrow \mathcal{G}$ is an isomorphism.

Let \mathcal{F} be a sheaf on \mathcal{C} . Recall that $a_*a^{-1}\mathcal{F}$ is the equalizer of the two maps $a_{0,*}a_0^{-1}\mathcal{F} \rightarrow a_{1,*}a_1^{-1}\mathcal{F}$, see Lemma 17.2. By Lemma 16.2

$$a_{0,*}a_0^{-1}\mathcal{F} = \mathcal{H}om(F(K_0)^{\#}, \mathcal{F}) \quad \text{and} \quad a_{1,*}a_1^{-1}\mathcal{F} = \mathcal{H}om(F(K_1)^{\#}, \mathcal{F})$$

On the other hand, we know that

$$F(K_1)^{\#} \begin{array}{c} \longrightarrow \\ \twoheadrightarrow \end{array} F(K_0)^{\#} \longrightarrow \text{final object } * \text{ of } Sh(\mathcal{C})$$

is a coequalizer diagram in sheaves of sets by definition of a hypercovering. Thus it suffices to prove that $\mathcal{H}om(-, \mathcal{F})$ transforms coequalizers into equalizers which is immediate from the construction in Sites, Section 25.

Let \mathcal{G} be a cartesian sheaf on $(\mathcal{C}/K)_{total}$. We will show that $\mathcal{G} = a^{-1}\mathcal{F}$ for some sheaf \mathcal{F} on \mathcal{C} . This will finish the proof because then $a^{-1}a_*\mathcal{G} = a^{-1}a_*a^{-1}\mathcal{F} = a^{-1}\mathcal{F} = \mathcal{G}$ by the result of the previous paragraph. Set $\mathcal{K}_n = F(K_n)^\#$ for $n \geq 0$. Then we have maps of sheaves

$$\mathcal{K}_2 \rightrightarrows \mathcal{K}_1 \rightrightarrows \mathcal{K}_0$$

coming from the fact that K is a simplicial semi-representable object. The fact that K is a hypercovering means that

$$\mathcal{K}_1 \rightarrow \mathcal{K}_0 \times \mathcal{K}_0 \quad \text{and} \quad \mathcal{K}_2 \rightarrow \left(\text{cosq}_1(\mathcal{K}_1 \rightrightarrows \mathcal{K}_0) \right)_2$$

are surjective maps of sheaves. Using the description of cartesian sheaves on $(\mathcal{C}/K)_{total}$ given in Lemma 12.4 and using the description of $Sh(\mathcal{C}/K_n)$ in Lemma 16.3 we find that our problem can be entirely formulated³ in terms of

- (1) the topos $Sh(\mathcal{C})$, and
- (2) the simplicial object \mathcal{K} in $Sh(\mathcal{C})$ whose terms are \mathcal{K}_n .

Thus, after replacing \mathcal{C} by a different site \mathcal{C}' as in Sites, Lemma 28.5, we may assume \mathcal{C} has all finite limits, the topology on \mathcal{C} is subcanonical, a family $\{V_j \rightarrow V\}$ of morphisms of \mathcal{C} is a covering if and only if $\coprod h_{V_j} \rightarrow V$ is surjective, and there exists a simplicial object U of \mathcal{C} such that $\mathcal{K}_n = h_{U_n}$ as simplicial sheaves. Working backwards through the equivalences we may assume $K_n = \{U_n\}$ for all n .

Let X be the final object of \mathcal{C} . Then $\{U_0 \rightarrow X\}$ is a covering, $\{U_1 \rightarrow U_0 \times U_0\}$ is a covering, and $\{U_2 \rightarrow (\text{cosq}_1 \text{sk}_1 U)_2\}$ is a covering. Let us use $d_i^n : U_n \rightarrow U_{n-1}$ and $s_j^n : U_n \rightarrow U_{n+1}$ the morphisms corresponding to δ_i^n and σ_j^n as in Simplicial, Definition 2.1. By abuse of notation, given a morphism $c : V \rightarrow W$ of \mathcal{C} we denote the morphism of topoi $c : Sh(\mathcal{C}/V) \rightarrow Sh(\mathcal{C}/W)$ by the same letter. Now \mathcal{G} is given by a sheaf \mathcal{G}_0 on \mathcal{C}/U_0 and an isomorphism $\alpha : (d_1^1)^{-1}\mathcal{G}_0 \rightarrow (d_0^1)^{-1}\mathcal{G}_0$ satisfying the cocycle condition on \mathcal{C}/U_2 formulated in Lemma 12.4. Since $\{U_2 \rightarrow (\text{cosq}_1 \text{sk}_1 U)_2\}$ is a covering, the corresponding pullback functor on sheaves is faithful (small detail omitted). Hence we may replace U by $\text{cosk}_1 \text{sk}_1 U$, because this replaces U_2 by $(\text{cosq}_1 \text{sk}_1 U)_2$ and leaves U_1 and U_0 unchanged. Then

$$(d_0^2, d_1^2, d_2^2) : U_2 \rightarrow U_1 \times U_1 \times U_1$$

is a monomorphism whose its image on T -valued points is described in Simplicial, Lemma 19.6. In particular, there is a morphism c fitting into a commutative diagram

$$\begin{array}{ccc} U_1 \times_{(d_1^1, d_0^1), U_0 \times U_0, (d_1^1, d_0^1)} U_1 & \xrightarrow{c} & U_2 \\ \downarrow & & \downarrow \\ U_1 \times U_1 & \xrightarrow{(\text{pr}_1, \text{pr}_2, s_0^0 \circ d_1^1 \circ \text{pr}_1)} & U_1 \times U_1 \times U_1 \end{array}$$

³Even though it does not matter what the precise formulation is, we spell it out: the problem is to show that given an object $\mathcal{G}_0/\mathcal{K}_0$ of $Sh(\mathcal{C})/\mathcal{K}_0$ and an isomorphism

$$\alpha : \mathcal{G}_0 \times_{\mathcal{K}_0, \mathcal{K}(\delta_1^1)} \mathcal{K}_1 \rightarrow \mathcal{G}_0 \times_{\mathcal{K}_0, \mathcal{K}(\delta_0^1)} \mathcal{K}_1$$

over \mathcal{K}_1 satisfying a cocycle condition in $Sh(\mathcal{C})/\mathcal{K}_2$, there exists \mathcal{F} in $Sh(\mathcal{C})$ and an isomorphism $\mathcal{F} \times \mathcal{K}_0 \rightarrow \mathcal{G}_0$ over \mathcal{K}_0 compatible with α .

as going around the other way defines a point of U_2 . Pulling back the cocycle condition for α on U_2 translates into the condition that the pullbacks of α via the projections to $U_1 \times_{(d_1^1, d_0^1), U_0 \times U_0, (d_1^1, d_0^1)} U_1$ are the same as the pullback of α via $s_0^0 \circ d_1^1 \circ \text{pr}_1$ is the identity map (namely, the pullback of α by s_0^0 is the identity). By Sites, Lemma 25.1 this means that α comes from an isomorphism

$$\alpha' : \text{pr}_1^{-1}\mathcal{G}_0 \rightarrow \text{pr}_2^{-1}\mathcal{G}_0$$

of sheaves on $\mathcal{C}/U_0 \times U_0$. Then finally, the morphism $U_2 \rightarrow U_0 \times U_0 \times U_0$ is surjective on associated sheaves as is easily seen using the surjectivity of $U_1 \rightarrow U_0 \times U_0$ and the description of U_2 given above. Therefore α' satisfies the cocycle condition on $U_0 \times U_0 \times U_0$. The proof is finished by an application of Sites, Lemma 25.5 to the covering $\{U_0 \rightarrow X\}$. \square

0D8F **Lemma 18.2.** *Let \mathcal{C} be a site with equalizers and fibre products. Let K be a hypercovering. The Čech complex of Lemma 9.2 associated to $a^{-1}\mathcal{F}$*

$$a_{0,*}a_0^{-1}\mathcal{F} \rightarrow a_{1,*}a_1^{-1}\mathcal{F} \rightarrow a_{2,*}a_2^{-1}\mathcal{F} \rightarrow \dots$$

is equal to the complex $\mathcal{H}om(s(\mathbf{Z}_{F(K)}^\#), \mathcal{F})$. Here $s(\mathbf{Z}_{F(K)}^\#)$ is as in Hypercoverings, Definition 4.1.

Proof. By Lemma 16.2 we have

$$a_{n,*}a_n^{-1}\mathcal{F} = \mathcal{H}om'(F(K_n)^\#, \mathcal{F})$$

where $\mathcal{H}om'$ is as in Sites, Section 25. The boundary maps in the complex of Lemma 9.2 come from the simplicial structure. Thus the equality of complexes comes from the canonical identifications $\mathcal{H}om'(\mathcal{G}, \mathcal{F}) = \mathcal{H}om(\mathbf{Z}_{\mathcal{G}}, \mathcal{F})$ for \mathcal{G} in $Sh(\mathcal{C})$. \square

0D8G **Lemma 18.3.** *Let \mathcal{C} be a site with equalizers and fibre products. Let K be a hypercovering. For $E \in D^+(\mathcal{C})$ the map*

$$E \longrightarrow Ra_*a^{-1}E$$

is an isomorphism.

Proof. First, let \mathcal{I} be an injective abelian sheaf on \mathcal{C} . Then the spectral sequence of Lemma 9.3 for the sheaf $a^{-1}\mathcal{I}$ degenerates as $(a^{-1}\mathcal{I})_p = a_p^{-1}\mathcal{I}$ is injective by Lemma 16.4. Thus the complex

$$a_{0,*}a_0^{-1}\mathcal{I} \rightarrow a_{1,*}a_1^{-1}\mathcal{I} \rightarrow a_{2,*}a_2^{-1}\mathcal{I} \rightarrow \dots$$

computes $Ra_*a^{-1}\mathcal{I}$. By Lemma 18.2 this is equal to the complex $\mathcal{H}om(s(\mathbf{Z}_{F(K)}^\#), \mathcal{I})$. Because K is a hypercovering, we see that $s(\mathbf{Z}_{F(K)}^\#)$ is exact in degrees > 0 by Hypercoverings, Lemma 4.4 applied to the simplicial presheaf $F(K)$. Since \mathcal{I} is injective, the functor $\mathcal{H}om(-, \mathcal{I})$ is exact and we conclude that $\mathcal{H}om(s(\mathbf{Z}_{F(K)}^\#), \mathcal{I})$ is exact in positive degrees. We conclude that $R^p a_* a^{-1}\mathcal{I} = 0$ for $p > 0$. On the other hand, we have $\mathcal{I} = a_* a^{-1}\mathcal{I}$ by Lemma 18.1.

Next, let E be as in the statement of the lemma. Choose a bounded below complex \mathcal{I}^\bullet of injectives representing E . By the result of the first paragraph and Leray's acyclicity lemma (Derived Categories, Lemma 17.7) $Ra_* a^{-1}\mathcal{I}^\bullet$ is computed by the complex $a_* a^{-1}\mathcal{I}^\bullet = \mathcal{I}^\bullet$ and we conclude the lemma is true. \square

0D8H **Lemma 18.4.** *Let \mathcal{C} be a site with equalizers and fibre products. Let K be a hypercovering. Then we have a canonical isomorphism*

$$R\Gamma(\mathcal{C}, E) = R\Gamma((\mathcal{C}/K)_{total}, a^{-1}E)$$

for $E \in D^+(\mathcal{C})$.

Proof. This follows from Lemma 18.3 because $R\Gamma((\mathcal{C}/K)_{total}, -) = R\Gamma(\mathcal{C}, -) \circ Ra_*$ by Cohomology on Sites, Remark 15.4. \square

0D8I **Lemma 18.5.** *Let \mathcal{C} be a site with equalizers and fibre products. Let K be a hypercovering. Let $\mathcal{A} \subset Ab((\mathcal{C}/K)_{total})$ denote the weak Serre subcategory of cartesian abelian sheaves. Then the functor a^{-1} defines an equivalence*

$$D^+(\mathcal{C}) \longrightarrow D_{\mathcal{A}}^+((\mathcal{C}/K)_{total})$$

with quasi-inverse Ra_* .

Proof. Observe that \mathcal{A} is a weak Serre subcategory by Lemma 12.6. The equivalence is a formal consequence of the results obtained so far. Use Lemmas 13.5, 18.1, and 18.3. \square

We urge the reader to skip the following remark.

09X6 **Remark 18.6.** Let \mathcal{C} be a site. Let \mathcal{G} be a presheaf of sets on \mathcal{C} . If \mathcal{C} has equalizers and fibre products, then we've defined the notion of a hypercovering of \mathcal{G} in Hypercoverings, Definition 6.1. We claim that all the results in this section have a valid counterpart in this setting. To see this, define the localization \mathcal{C}/\mathcal{G} of \mathcal{C} at \mathcal{G} exactly as in Sites, Lemma 29.3 (which is stated only for sheaves; the topos $Sh(\mathcal{C}/\mathcal{G})$ is equal to the localization of the topos $Sh(\mathcal{C})$ at the sheaf $\mathcal{G}^\#$). Then the reader easily shows that the site \mathcal{C}/\mathcal{G} has fibre products and equalizers and that a hypercovering of \mathcal{G} in \mathcal{C} is the same thing as a hypercovering for the site \mathcal{C}/\mathcal{G} . Hence replacing the site \mathcal{C} by \mathcal{C}/\mathcal{G} in the lemmas on hypercoverings above we obtain proofs of the corresponding results for hypercoverings of \mathcal{G} . Example: for a hypercovering K of \mathcal{G} we have

$$R\Gamma(\mathcal{C}/\mathcal{G}, E) = R\Gamma((\mathcal{C}/K)_{total}, a^{-1}E)$$

for $E \in D^+(\mathcal{C}/\mathcal{G})$ where $a : Sh((\mathcal{C}/K)_{total}) \rightarrow Sh(\mathcal{C}/\mathcal{G})$ is the canonical augmentation. This is Lemma 18.4. Let $R\Gamma(\mathcal{G}, -) : D(\mathcal{C}) \rightarrow D(Ab)$ be defined as the derived functor of the functor $H^0(\mathcal{G}, -) = H^0(\mathcal{G}^\#, -)$ discussed in Hypercoverings, Section 6 and Cohomology on Sites, Section 14. We have

$$R\Gamma(\mathcal{G}, E) = R\Gamma(\mathcal{C}/\mathcal{G}, j^{-1}E)$$

by the analogue of Cohomology on Sites, Lemma 8.1 for the localization functor $j : \mathcal{C}/\mathcal{G} \rightarrow \mathcal{C}$. Putting everything together we obtain

$$R\Gamma(\mathcal{G}, E) = R\Gamma((\mathcal{C}/K)_{total}, a^{-1}j^{-1}E) = R\Gamma((\mathcal{C}/K)_{total}, g^{-1}E)$$

for $E \in D^+(\mathcal{C})$ where $g : Sh((\mathcal{C}/K)_{total}) \rightarrow Sh(\mathcal{C})$ is the composition of a and j .

19. Cohomological descent for hypercoverings: modules

0D9Y Let \mathcal{C} be a site. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings. Assume \mathcal{C} has equalizers and fibre products and let K be a hypercovering as defined in Hypercoverings, Definition 6.1. We will study cohomological descent for the augmentation

$$a : (Sh((\mathcal{C}/K)_{total}), \mathcal{O}) \longrightarrow (Sh(\mathcal{C}), \mathcal{O}_{\mathcal{C}})$$

of Remark 17.5.

0D9Z **Lemma 19.1.** *Let \mathcal{C} be a site with equalizers and fibre products. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings. Let K be a hypercovering. With notation as above*

$$a^* : Mod(\mathcal{O}_{\mathcal{C}}) \rightarrow Mod(\mathcal{O})$$

is fully faithful with essential image the cartesian \mathcal{O} -modules. The functor a_ provides the quasi-inverse.*

Proof. Since $a^{-1}\mathcal{O}_{\mathcal{C}} = \mathcal{O}$ we have $a^* = a^{-1}$. Hence the lemma follows immediately from Lemma 18.1. \square

0DA0 **Lemma 19.2.** *Let \mathcal{C} be a site with equalizers and fibre products. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings. Let K be a hypercovering. For $E \in D^+(\mathcal{O}_{\mathcal{C}})$ the map*

$$E \longrightarrow Ra_*La^*E$$

is an isomorphism.

Proof. Since $a^{-1}\mathcal{O}_{\mathcal{C}} = \mathcal{O}$ we have $La^* = a^* = a^{-1}$. Moreover Ra_* agrees with Ra_* on abelian sheaves, see Cohomology on Sites, Lemma 21.7. Hence the lemma follows immediately from Lemma 18.3. \square

0DA1 **Lemma 19.3.** *Let \mathcal{C} be a site with equalizers and fibre products. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings. Let K be a hypercovering. Then we have a canonical isomorphism*

$$R\Gamma(\mathcal{C}, E) = R\Gamma((\mathcal{C}/K)_{total}, La^*E)$$

for $E \in D^+(\mathcal{O}_{\mathcal{C}})$.

Proof. This follows from Lemma 19.2 because $R\Gamma((\mathcal{C}/K)_{total}, -) = R\Gamma(\mathcal{C}, -) \circ Ra_*$ by Cohomology on Sites, Remark 15.4 or by Cohomology on Sites, Lemma 21.5. \square

0DA2 **Lemma 19.4.** *Let \mathcal{C} be a site with equalizers and fibre products. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings. Let K be a hypercovering. Let $\mathcal{A} \subset Mod(\mathcal{O})$ denote the weak Serre subcategory of cartesian \mathcal{O} -modules. Then the functor La^* defines an equivalence*

$$D^+(\mathcal{O}_{\mathcal{C}}) \longrightarrow D_{\mathcal{A}}^+(\mathcal{O})$$

with quasi-inverse Ra_ .*

Proof. Observe that \mathcal{A} is a weak Serre subcategory by Lemma 12.6 (the required hypotheses hold by the discussion in Remark 17.5). The equivalence is a formal consequence of the results obtained so far. Use Lemmas 13.5, 19.1, and 19.2. \square

20. Cohomological descent for hypercoverings of an object

0D8J In this section we assume \mathcal{C} has fibre products and $X \in \text{Ob}(\mathcal{C})$. We let K be a hypercovering of X as defined in Hypercoverings, Definition 3.3. We will study the augmentation

$$a : \text{Sh}((\mathcal{C}/K)_{total}) \longrightarrow \text{Sh}(\mathcal{C}/X)$$

of Remark 17.4. Observe that \mathcal{C}/X is a site which has equalizers and fibre products and that K is a hypercovering for the site \mathcal{C}/X ⁴ by Hypercoverings, Lemma 3.7. This means that every single result proved for hypercoverings in Section 18 has an immediate analogue in the situation in this section.

0D8K **Lemma 20.1.** *Let \mathcal{C} be a site with fibre products and $X \in \text{Ob}(\mathcal{C})$. Let K be a hypercovering of X . Then*

- (1) $a^{-1} : \text{Sh}(\mathcal{C}/X) \rightarrow \text{Sh}((\mathcal{C}/K)_{total})$ is fully faithful with essential image the cartesian sheaves of sets,
- (2) $a^{-1} : \text{Ab}(\mathcal{C}/X) \rightarrow \text{Ab}((\mathcal{C}/K)_{total})$ is fully faithful with essential image the cartesian sheaves of abelian groups.

In both cases a_ provides the quasi-inverse functor.*

Proof. Via Remarks 16.5 and 17.4 and the discussion in the introduction to this section this follows from Lemma 18.1. \square

0D8L **Lemma 20.2.** *Let \mathcal{C} be a site with fibre product and $X \in \text{Ob}(\mathcal{C})$. Let K be a hypercovering of X . For $E \in D^+(\mathcal{C}/X)$ the map*

$$E \longrightarrow Ra_*a^{-1}E$$

is an isomorphism.

Proof. Via Remarks 16.5 and 17.4 and the discussion in the introduction to this section this follows from Lemma 18.3. \square

09X7 **Lemma 20.3.** *Let \mathcal{C} be a site with fibre products and $X \in \text{Ob}(\mathcal{C})$. Let K be a hypercovering of X . Then we have a canonical isomorphism*

$$R\Gamma(X, E) = R\Gamma((\mathcal{C}/K)_{total}, a^{-1}E)$$

for $E \in D^+(\mathcal{C}/X)$.

Proof. Via Remarks 16.5 and 17.4 this follows from Lemma 18.4. \square

0D8M **Lemma 20.4.** *Let \mathcal{C} be a site with fibre products and $X \in \text{Ob}(\mathcal{C})$. Let K be a hypercovering of X . Let $\mathcal{A} \subset \text{Ab}((\mathcal{C}/K)_{total})$ denote the weak Serre subcategory of cartesian abelian sheaves. Then the functor a^{-1} defines an equivalence*

$$D^+(\mathcal{C}/X) \longrightarrow D_{\mathcal{A}}^+((\mathcal{C}/K)_{total})$$

with quasi-inverse Ra_ .*

Proof. Via Remarks 16.5 and 17.4 this follows from Lemma 18.5. \square

⁴The converse may not be the case, i.e., if K is a simplicial object of $\text{SR}(\mathcal{C}, X) = \text{SR}(\mathcal{C}/X)$ which defines a hypercovering for the site \mathcal{C}/X as in Hypercoverings, Definition 6.1, then it may not be true that K defines a hypercovering of X . For example, if $K_0 = \{U_{0,i}\}_{i \in I_0}$ then the latter condition guarantees $\{U_{0,i} \rightarrow X\}$ is a covering of \mathcal{C} whereas the former condition only requires $\coprod h_{U_{0,i}}^\# \rightarrow h_X^\#$ to be a surjective map of sheaves.

21. Cohomological descent for hypercoverings of an object: modules

0DA3 In this section we assume \mathcal{C} has fibre products and $X \in \text{Ob}(\mathcal{C})$. We let K be a hypercovering of X as defined in Hypercoverings, Definition 3.3. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings on \mathcal{C} . Set $\mathcal{O}_X = \mathcal{O}_{\mathcal{C}}|_{\mathcal{C}/X}$. We will study the augmentation

$$a : (Sh((\mathcal{C}/K)_{total}), \mathcal{O}) \longrightarrow (Sh(\mathcal{C}/X), \mathcal{O}_X)$$

of Remark 17.6. Observe that \mathcal{C}/X is a site which has equalizers and fibre products and that K is a hypercovering for the site \mathcal{C}/X . Therefore the results in this section are immediate consequences of the corresponding results in Section 19.

0DA4 **Lemma 21.1.** *Let \mathcal{C} be a site with fibre products and $X \in \text{Ob}(\mathcal{C})$. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings. Let K be a hypercovering of X . With notation as above*

$$a^* : Mod(\mathcal{O}_X) \rightarrow Mod(\mathcal{O})$$

is fully faithful with essential image the cartesian \mathcal{O} -modules. The functor a_ provides the quasi-inverse.*

Proof. Via Remarks 16.7 and 17.6 and the discussion in the introduction to this section this follows from Lemma 19.1. \square

0DA5 **Lemma 21.2.** *Let \mathcal{C} be a site with fibre products and $X \in \text{Ob}(\mathcal{C})$. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings. Let K be a hypercovering of X . For $E \in D^+(\mathcal{O}_X)$ the map*

$$E \longrightarrow Ra_*La^*E$$

is an isomorphism.

Proof. Via Remarks 16.7 and 17.6 and the discussion in the introduction to this section this follows from Lemma 19.2. \square

0DA6 **Lemma 21.3.** *Let \mathcal{C} be a site with fibre products and $X \in \text{Ob}(\mathcal{C})$. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings. Let K be a hypercovering of X . Then we have a canonical isomorphism*

$$R\Gamma(X, E) = R\Gamma((\mathcal{C}/K)_{total}, La^*E)$$

for $E \in D^+(\mathcal{O}_{\mathcal{C}})$.

Proof. Via Remarks 16.7 and 17.6 and the discussion in the introduction to this section this follows from Lemma 19.3. \square

0DA7 **Lemma 21.4.** *Let \mathcal{C} be a site with fibre products and $X \in \text{Ob}(\mathcal{C})$. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings. Let K be a hypercovering of X . Let $\mathcal{A} \subset Mod(\mathcal{O})$ denote the weak Serre subcategory of cartesian \mathcal{O} -modules. Then the functor La^* defines an equivalence*

$$D^+(\mathcal{O}_X) \longrightarrow D^+_{\mathcal{A}}(\mathcal{O})$$

with quasi-inverse Ra_ .*

Proof. Via Remarks 16.7 and 17.6 and the discussion in the introduction to this section this follows from Lemma 19.4. \square

22. Hypercovering by a simplicial object of the site

09X8 Let \mathcal{C} be a site with fibre products and let $X \in \text{Ob}(\mathcal{C})$. In this section we elucidate the results of Section 20 in the case that our hypercovering is given by a simplicial object of the site. Let U be a simplicial object of \mathcal{C} . As usual we denote $U_n = U([n])$ and $f_\varphi : U_n \rightarrow U_m$ the morphism $f_\varphi = U(\varphi)$ corresponding to $\varphi : [m] \rightarrow [n]$. Assume we have an augmentation

$$a : U \rightarrow X$$

From this we obtain a simplicial site $(\mathcal{C}/U)_{total}$ and an augmentation morphism

$$a : Sh((\mathcal{C}/U)_{total}) \longrightarrow Sh(\mathcal{C}/X)$$

by thinking of U as a simplicial semi-representable object of \mathcal{C}/X whose degree n part is the singleton element $\{U_n/X\}$ and applying the constructions in Remark 17.4.

An object of the site $(\mathcal{C}/U)_{total}$ is given by a V/U_n and a morphism $(\varphi, f) : V/U_n \rightarrow W/U_m$ is given by a morphism $\varphi : [m] \rightarrow [n]$ in Δ and a morphism $f : V \rightarrow W$ such that the diagram

$$\begin{array}{ccc} V & \xrightarrow{\quad} & W \\ \downarrow & \searrow f & \downarrow \\ U_n & \xrightarrow{f_\varphi} & U_m \end{array}$$

is commutative. The morphism of topoi a is given by the cocontinuous functor $V/U_n \mapsto V/X$. That's all folks!

Let us say that the augmentation $a : U \rightarrow X$ is a *hypercovering of X in \mathcal{C}* if the following hold

- (1) $\{U_0 \rightarrow X\}$ is a covering of \mathcal{C} ,
- (2) $\{U_1 \rightarrow U_0 \times_X U_0\}$ is a covering of \mathcal{C} ,
- (3) $\{U_{n+1} \rightarrow (\text{cosk}_n \text{sk}_n U)_{n+1}\}$ is a covering of \mathcal{C} for $n \geq 1$.

The category \mathcal{C}/X has all connected finite limits, hence the coskeleta used in the formulation above exist. Of course, we see that U is a hypercovering of X in \mathcal{C} if and only if the simplicial semi-representable object $\{U_n\}$ is a hypercovering of X in the sense of Section 20.

0DA8 **Lemma 22.1.** *Let \mathcal{C} be a site with fibre product and $X \in \text{Ob}(\mathcal{C})$. Let $a : U \rightarrow X$ be a hypercovering of X in \mathcal{C} as defined above. Then*

- (1) $a^{-1} : Sh(\mathcal{C}/X) \rightarrow Sh((\mathcal{C}/U)_{total})$ is fully faithful with essential image the cartesian sheaves of sets,
- (2) $a^{-1} : Ab(\mathcal{C}/X) \rightarrow Ab((\mathcal{C}/U)_{total})$ is fully faithful with essential image the cartesian sheaves of abelian groups.

In both cases a_ provides the quasi-inverse functor.*

Proof. This is a special case of Lemma 20.1. □

0D8N **Lemma 22.2.** *Let \mathcal{C} be a site with fibre product and $X \in \text{Ob}(\mathcal{C})$. Let $a : U \rightarrow X$ be a hypercovering of X in \mathcal{C} as defined above. For $E \in D^+(\mathcal{C}/X)$ the map*

$$E \longrightarrow Ra_* a^{-1} E$$

is an isomorphism.

Proof. This is a special case of Lemma 20.2. \square

09X9 **Lemma 22.3.** *Let \mathcal{C} be a site with fibre products and $X \in \text{Ob}(\mathcal{C})$. Let $a : U \rightarrow X$ be a hypercovering of X in \mathcal{C} as defined above. Then we have a canonical isomorphism*

$$R\Gamma(X, E) = R\Gamma((\mathcal{C}/U)_{total}, a^{-1}E)$$

for $E \in D^+(\mathcal{C}/X)$.

Proof. This is a special case of Lemma 20.3. \square

0DA9 **Lemma 22.4.** *Let \mathcal{C} be a site with fibre product and $X \in \text{Ob}(\mathcal{C})$. Let $a : U \rightarrow X$ be a hypercovering of X in \mathcal{C} as defined above. Let $\mathcal{A} \subset \text{Ab}((\mathcal{C}/U)_{total})$ denote the weak Serre subcategory of cartesian abelian sheaves. Then the functor a^{-1} defines an equivalence*

$$D^+(\mathcal{C}/X) \longrightarrow D_{\mathcal{A}}^+((\mathcal{C}/U)_{total})$$

with quasi-inverse Ra_* .

Proof. This is a special case of Lemma 20.4 \square

09WL **Lemma 22.5.** *Let U be a simplicial object of a site \mathcal{C} with fibre products.*

- (1) \mathcal{C}/U has the structure of a simplicial object in the category whose objects are sites and whose morphisms are morphisms of sites,
- (2) the construction of Lemma 3.1 applied to the structure in (1) reproduces the site $(\mathcal{C}/U)_{total}$ above,
- (3) if $a : U \rightarrow X$ is an augmentation, then $a_0 : \mathcal{C}/U_0 \rightarrow \mathcal{C}/X$ is an augmentation as in Remark 4.1 part (A) and gives the same morphism of topoi $a : \text{Sh}((\mathcal{C}/U)_{total}) \rightarrow \text{Sh}(\mathcal{C}/X)$ as the one above.

Proof. Given a morphism of objects $V \rightarrow W$ of \mathcal{C} the localization morphism $j : \mathcal{C}/V \rightarrow \mathcal{C}/W$ is a left adjoint to the base change functor $\mathcal{C}/W \rightarrow \mathcal{C}/V$. The base change functor is continuous and induces the same morphism of topoi as j . See Sites, Lemma 26.3. This proves (1).

Part (2) holds because a morphism $V/U_n \rightarrow W/U_m$ of the category constructed in Lemma 3.1 is a morphism $V \rightarrow W \times_{U_m, f_\varphi} U_n$ over U_n which is the same thing as a morphism $f : V \rightarrow W$ over the morphism $f_\varphi : U_n \rightarrow U_m$, i.e., the same thing as a morphism in the category $(\mathcal{C}/U)_{total}$ defined above. Equality of sets of coverings is immediate from the definition.

We omit the proof of (3). \square

23. Hypercovering by a simplicial object of the site: modules

0DAA Let \mathcal{C} be a site with fibre products and $X \in \text{Ob}(\mathcal{C})$. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings on \mathcal{C} . Let $U \rightarrow X$ be a hypercovering of X in \mathcal{C} as defined in Section 22. In this section we study the augmentation

$$a : (\text{Sh}((\mathcal{C}/U)_{total}), \mathcal{O}) \longrightarrow (\text{Sh}(\mathcal{C}/X), \mathcal{O}_X)$$

we obtain by thinking of U as a simplicial semi-representable object of \mathcal{C}/X whose degree n part is the singleton element $\{U_n/X\}$ and applying the constructions in Remark 17.6. Thus all the results in this section are immediate consequences of the corresponding results in Section 21.

0DAB **Lemma 23.1.** *Let \mathcal{C} be a site with fibre products and $X \in \text{Ob}(\mathcal{C})$. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings. Let U be a hypercovering of X in \mathcal{C} . With notation as above*

$$a^* : \text{Mod}(\mathcal{O}_X) \rightarrow \text{Mod}(\mathcal{O})$$

is fully faithful with essential image the cartesian \mathcal{O} -modules. The functor a_ provides the quasi-inverse.*

Proof. This is a special case of Lemma 21.1. \square

0DAC **Lemma 23.2.** *Let \mathcal{C} be a site with fibre products and $X \in \text{Ob}(\mathcal{C})$. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings. Let U be a hypercovering of X in \mathcal{C} . For $E \in D^+(\mathcal{O}_X)$ the map*

$$E \longrightarrow \text{Ra}_* \text{La}^* E$$

is an isomorphism.

Proof. This is a special case of Lemma 21.2. \square

0DAD **Lemma 23.3.** *Let \mathcal{C} be a site with fibre products and $X \in \text{Ob}(\mathcal{C})$. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings. Let U be a hypercovering of X in \mathcal{C} . Then we have a canonical isomorphism*

$$R\Gamma(X, E) = R\Gamma((\mathcal{C}/U)_{\text{total}}, \text{La}^* E)$$

for $E \in D^+(\mathcal{O}_{\mathcal{C}})$.

Proof. This is a special case of Lemma 21.3. \square

0DAE **Lemma 23.4.** *Let \mathcal{C} be a site with fibre products and $X \in \text{Ob}(\mathcal{C})$. Let $\mathcal{O}_{\mathcal{C}}$ be a sheaf of rings. Let U be a hypercovering of X in \mathcal{C} . Let $\mathcal{A} \subset \text{Mod}(\mathcal{O})$ denote the weak Serre subcategory of cartesian \mathcal{O} -modules. Then the functor La^* defines an equivalence*

$$D^+(\mathcal{O}_X) \longrightarrow D_{\mathcal{A}}^+(\mathcal{O})$$

with quasi-inverse Ra_ .*

Proof. This is a special case of Lemma 21.4. \square

24. Unbounded cohomological descent for hypercoverings

0DC1 In this section we discuss unbounded cohomological descent. The results themselves will be immediate consequences of our results on bounded cohomological descent in the previous sections and Lemmas 13.6 and/or 13.7; the real work lies in setting up notation and choosing appropriate assumptions. Our discussion is motivated by the discussion in [LO08] although the details are a good bit different.

Let $(\mathcal{C}, \mathcal{O}_{\mathcal{C}})$ be a ringed site. Assume given for every object U of \mathcal{C} a weak Serre subcategory $\mathcal{A}_U \subset \text{Mod}(\mathcal{O}_U)$ satisfying the following properties

- 0DC2 (1) given a morphism $U \rightarrow V$ of \mathcal{C} the restriction functor $\text{Mod}(\mathcal{O}_V) \rightarrow \text{Mod}(\mathcal{O}_U)$ sends \mathcal{A}_V into \mathcal{A}_U ,
- 0DC3 (2) given a covering $\{U_i \rightarrow U\}_{i \in I}$ of \mathcal{C} an object \mathcal{F} of $\text{Mod}(\mathcal{O}_U)$ is in \mathcal{A}_U if and only if the restriction of \mathcal{F} to \mathcal{C}/U_i is in \mathcal{A}_{U_i} for all $i \in I$.
- 0DC4 (3) there exists a subset $\mathcal{B} \subset \text{Ob}(\mathcal{C})$ such that
 - (a) every object of \mathcal{C} has a covering whose members are in \mathcal{B} , and
 - (b) for every $V \in \mathcal{B}$ there exists an integer d_V and a cofinal system Cov_V of coverings of V such that

$$H^p(V_i, \mathcal{F}) = 0 \text{ for } \{V_i \rightarrow V\} \in \text{Cov}_V, p > d_V, \text{ and } \mathcal{F} \in \text{Ob}(\mathcal{A}_V)$$

Note that we require this to be true for \mathcal{F} in \mathcal{A}_V and not just for “global” objects (and thus it is stronger than the condition imposed in Cohomology on Sites, Situation 24.1). In this situation, there is a weak Serre subcategory $\mathcal{A} \subset \text{Mod}(\mathcal{O}_{\mathcal{C}})$ consisting of objects whose restriction to \mathcal{C}/U is in \mathcal{A}_U for all $U \in \text{Ob}(\mathcal{C})$. Moreover, there are derived categories $D_{\mathcal{A}}(\mathcal{O}_{\mathcal{C}})$ and $D_{\mathcal{A}_U}(\mathcal{O}_U)$ and the restriction functors send these into each other.

0DC5 **Example 24.1.** Let S be a scheme and let X be an algebraic space over S . Let $\mathcal{C} = X_{\text{spaces}, \text{étale}}$ be the étale site on the category of algebraic spaces étale over X , see Properties of Spaces, Definition 18.2. Denote $\mathcal{O}_{\mathcal{C}}$ the structure sheaf, i.e., the sheaf given by the rule $U \mapsto \Gamma(U, \mathcal{O}_U)$. Denote \mathcal{A}_U the category of quasi-coherent \mathcal{O}_U -modules. Let $\mathcal{B} = \text{Ob}(\mathcal{C})$ and for $V \in \mathcal{B}$ set $d_V = 0$ and let Cov_V denote the coverings $\{V_i \rightarrow V\}$ with V_i affine for all i . Then the assumptions (1), (2), (3) are satisfied. See Properties of Spaces, Lemmas 29.2 and 29.7 for properties (1) and (2) and the vanishing in (3) follows from Cohomology of Schemes, Lemma 2.2 and the discussion in Cohomology of Spaces, Section 3.

0DC6 **Example 24.2.** Let S be one of the following types of schemes

- (1) the spectrum of a finite field,
- (2) the spectrum of a separably closed field,
- (3) the spectrum of a strictly henselian Noetherian local ring,
- (4) the spectrum of a henselian Noetherian local ring with finite residue field,
- (5) add more here.

Let Λ be a finite ring whose order is invertible on S . Let $\mathcal{C} \subset (\text{Sch}/S)_{\text{étale}}$ be the full subcategory consisting of schemes locally of finite type over S endowed with the étale topology. Let $\mathcal{O}_{\mathcal{C}} = \underline{\Lambda}$ be the constant sheaf. Set $\mathcal{A}_U = \text{Mod}(\mathcal{O}_U)$, in other words, we consider all étale sheaves of Λ -modules. Let $\mathcal{B} \subset \text{Ob}(\mathcal{C})$ be the set of quasi-compact objects. For $V \in \mathcal{B}$ set

$$d_V = 1 + 2 \dim(S) + \sup_{v \in V} (\text{trdeg}_{\kappa(S)}(\kappa(v)) + 2 \dim \mathcal{O}_{V,v})$$

and let Cov_V denote the étale coverings $\{V_i \rightarrow V\}$ with V_i quasi-compact for all i . Our choice of bound d_V comes from Gabber’s theorem on cohomological dimension. To see that condition (3) holds with this choice, use [ILO14, Exposé VIII-A, Corollary 1.2 and Lemma 2.2] plus elementary arguments on cohomological dimensions of fields. We add 1 to the formula because our list contains cases where we allow S to have finite residue field. We will come back to this example later (insert future reference).

Let $(\mathcal{C}, \mathcal{O}_{\mathcal{C}})$ be a ringed site. Assume given weak Serre subcategories $\mathcal{A}_U \subset \text{Mod}(\mathcal{O}_U)$ satisfying condition (1). Then

- (1) given a semi-representable object $K = \{U_i\}_{i \in I}$ we get a weak Serre subcategory $\mathcal{A}_K \subset \text{Mod}(\mathcal{O}_K)$ by taking $\prod \mathcal{A}_{U_i} \subset \prod \text{Mod}(\mathcal{O}_{U_i}) = \text{Mod}(\mathcal{O}_K)$, and
- (2) given a morphism of semi-representable objects $f : K \rightarrow L$ the pullback map $f^* : \text{Mod}(\mathcal{O}_L) \rightarrow \text{Mod}(\mathcal{O}_K)$ sends \mathcal{A}_L into \mathcal{A}_K .

See Remark 16.6 for notation and explanation. In particular, given a simplicial semi-representable object K it is unambiguous to say what it means for an object \mathcal{F} of $\text{Mod}(\mathcal{O})$ as in Remark 17.5 to have restrictions \mathcal{F}_n in \mathcal{A}_{K_n} for all n .

0DC7 **Lemma 24.3.** *Let $(\mathcal{C}, \mathcal{O}_{\mathcal{C}})$ be a ringed site. Assume given weak Serre subcategories $\mathcal{A}_U \subset \text{Mod}(\mathcal{O}_U)$ satisfying conditions (1), (2), and (3) above. Assume \mathcal{C} has equalizers and fibre products and let K be a hypercovering. Let $((\mathcal{C}/K)_{total}, \mathcal{O})$ be as in Remark 17.5. Let $\mathcal{A}_{total} \subset \text{Mod}(\mathcal{O})$ denote the weak Serre subcategory of cartesian \mathcal{O} -modules \mathcal{F} whose restriction \mathcal{F}_n is in \mathcal{A}_{K_n} for all n (as defined above). Then the functor La^* defines an equivalence*

$$D_{\mathcal{A}}(\mathcal{O}_{\mathcal{C}}) \longrightarrow D_{\mathcal{A}_{total}}(\mathcal{O})$$

with quasi-inverse Ra_* .

Proof. The cartesian \mathcal{O} -modules form a weak Serre subcategory by Lemma 12.6 (the required hypotheses hold by the discussion in Remark 17.5). Since the restriction functor $g_n^* : \text{Mod}(\mathcal{O}) \rightarrow \text{Mod}(\mathcal{O}_n)$ are exact, it follows that \mathcal{A}_{total} is a weak Serre subcategory.

Let us show that $a^* : \mathcal{A} \rightarrow \mathcal{A}_{total}$ is an equivalence of categories with inverse given by La_* . We already know that $La_*a^*\mathcal{F} = \mathcal{F}$ by the bounded version (Lemma 19.4). It is clear that $a^*\mathcal{F}$ is in \mathcal{A}_{total} for \mathcal{F} in \mathcal{A} . Conversely, assume that $\mathcal{G} \in \mathcal{A}_{total}$. Because \mathcal{G} is cartesian we see that $\mathcal{G} = a^*\mathcal{F}$ for some $\mathcal{O}_{\mathcal{C}}$ -module \mathcal{F} by Lemma 19.1. We want to show that \mathcal{F} is in \mathcal{A} . Take $U \in \text{Ob}(\mathcal{C})$. We have to show that the restriction of \mathcal{F} to \mathcal{C}/U is in \mathcal{A}_U . As usual, write $K_0 = \{U_{0,i}\}_{i \in I_0}$. Since K is a hypercovering, the map $\coprod_{i \in I_0} h_{U_{0,i}} \rightarrow *$ becomes surjective after sheafification. This implies there is a covering $\{U_j \rightarrow U\}_{j \in J}$ and a map $\tau : J \rightarrow I_0$ and for each $j \in J$ a morphism $\varphi_j : U_j \rightarrow U_{0,\tau(j)}$. Since $\mathcal{G}_0 = a_0^*\mathcal{F}$ we find that the restriction of \mathcal{F} to \mathcal{C}/U_j is equal to the restriction of the $\tau(j)$ th component of \mathcal{G}_0 to \mathcal{C}/U_j via the morphism $\varphi_j : U_j \rightarrow U_{0,\tau(j)}$. Hence by (1) we find that $\mathcal{F}|_{\mathcal{C}/U_j}$ is in \mathcal{A}_{U_j} and in turn by (2) we find that $\mathcal{F}|_{\mathcal{C}/U}$ is in \mathcal{A}_U .

In particular the statement of the lemma makes sense. The lemma now follows from Lemma 13.6. Assumption (1) is clear (see Remark 17.5). Assumptions (2) and (3) we proved in the preceding paragraph. Assumption (4) is immediate from (3). For assumption (5) let \mathcal{B}_{total} be the set of objects $U/U_{n,i}$ of the site $(\mathcal{C}/K)_{total}$ such that $U \in \mathcal{B}$ where \mathcal{B} is as in (3). Here we use the description of the site $(\mathcal{C}/K)_{total}$ given in Section 17. Moreover, we set $\text{Cov}_{U/U_{n,i}}$ equal to Cov_U and $d_{U/U_{n,i}}$ equal to d_U where Cov_U and d_U are given to us by (3). Then we claim that condition (5) holds with these choices. This follows immediately from Lemma 17.3 and the fact that $\mathcal{F} \in \mathcal{A}_{total}$ implies $\mathcal{F}_n \in \mathcal{A}_{K_n}$ and hence $\mathcal{F}_{n,i} \in \mathcal{A}_{U_{n,i}}$. (The reader who worries about the difference between cohomology of abelian sheaves versus cohomology of sheaves of modules may consult Cohomology on Sites, Lemma 13.4.) \square

25. Glueing complexes

0DC8 This section is the continuation of Cohomology, Section 39. The goal is to prove a slight generalization of [BBD82, Theorem 3.2.4]. Our method will be a tiny bit different in that we use the material from Sections 14 and 15. We will also reprove the unbounded version as it is proved in [LO08].

Here is the situation we are interested in.

0DC9 **Situation 25.1.** Let $(\mathcal{C}, \mathcal{O}_{\mathcal{C}})$ be a ringed site. We are given

- (1) a category \mathcal{B} and a functor $u : \mathcal{B} \rightarrow \mathcal{C}$,
- (2) an object E_U in $D(\mathcal{O}_{u(U)})$ for $U \in \text{Ob}(\mathcal{B})$,

(3) an isomorphism $\rho_a : E_U|_{\mathcal{C}/u(V)} \rightarrow E_V$ in $D(\mathcal{O}_{u(V)})$ for $a : V \rightarrow U$ in \mathcal{B} such that whenever we have composable arrows $b : W \rightarrow V$ and $a : V \rightarrow U$ of \mathcal{B} , then $\rho_{a \circ b} = \rho_b \circ \rho_a|_{\mathcal{C}/u(W)}$.

We won't be able to prove anything about this without making more assumptions. An interesting case is where \mathcal{B} is a full subcategory such that every object of \mathcal{C} has a covering whose members are objects of \mathcal{B} (this is the case considered in [BBD82]). For us it is important to allow cases where this is not the case; the main alternative case is where we have a morphism of sites $f : \mathcal{C} \rightarrow \mathcal{D}$ and \mathcal{B} is a full subcategory of \mathcal{D} such that every object of \mathcal{D} has a covering whose members are objects of \mathcal{B} .

In Situation 25.1 a *solution* will be a pair (E, ρ_U) where E is an object of $D(\mathcal{O}_{\mathcal{C}})$ and $\rho_U : E|_{\mathcal{C}/u(U)} \rightarrow E_U$ for $U \in \text{Ob}(\mathcal{B})$ are isomorphisms such that we have $\rho_a \circ \rho_U|_{\mathcal{C}/u(V)} = \rho_V$ for $a : V \rightarrow U$ in \mathcal{B} .

ODCA Lemma 25.2. *In Situation 25.1. Assume negative self-exts of E_U in $D(\mathcal{O}_{u(U)})$ are zero. Let L be a simplicial object of $SR(\mathcal{B})$. Consider the simplicial object $K = u(L)$ of $SR(\mathcal{C})$ and let $((\mathcal{C}/K)_{total}, \mathcal{O})$ be as in Remark 17.5. There exists a cartesian object E of $D(\mathcal{O})$ such that writing $L_n = \{U_{n,i}\}_{i \in I_n}$ the restriction of E to $D(\mathcal{O}_{\mathcal{C}/u(U_{n,i})})$ is $E_{U_{n,i}}$ compatibly (see proof for details). Moreover, E is unique up to unique isomorphism.*

Proof. Recall that $Sh(\mathcal{C}/K_n) = \prod_{i \in I_n} Sh(\mathcal{C}/u(U_{n,i}))$ and similarly for the categories of modules. This product decomposition is also inherited by the derived categories of sheaves of modules. Moreover, this product decomposition is compatible with the morphisms in the simplicial semi-representable object K . See Section 16. Hence we can set $E_n = \prod_{i \in I_n} E_{U_{n,i}}$ (“formal” product) in $D(\mathcal{O}_n)$. Taking (formal) products of the maps ρ_a of Situation 25.1 we obtain isomorphisms $E_\varphi : f_\varphi^* E_n \rightarrow E_m$. The assumption about compositions of the maps ρ_a immediately implies that (E_n, E_φ) defines a simplicial system of the derived category of modules as in Definition 15.1. The vanishing of negative exts assumed in the lemma implies that $\text{Hom}(E_n[t], E_n) = 0$ for $n \geq 0$ and $t > 0$. Thus by Lemma 15.6 we obtain E . Uniqueness up to unique isomorphism follows from Lemmas 15.4 and 15.5. \square

ODCB Lemma 25.3 (BBD glueing lemma). *In Situation 25.1. Assume*

- (1) \mathcal{C} has equalizers and fibre products,
- (2) there is a morphism of sites $f : \mathcal{C} \rightarrow \mathcal{D}$ given by a continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$ such that
 - (a) \mathcal{D} has equalizers and fibre products and u commutes with them,
 - (b) \mathcal{B} is a full subcategory of \mathcal{D} and $u : \mathcal{B} \rightarrow \mathcal{C}$ is the restriction of u ,
 - (c) every object of \mathcal{D} has a covering whose members are objects of \mathcal{B} ,
- (3) all negative self-exts of E_U in $D(\mathcal{O}_{u(U)})$ are zero, and
- (4) there exists a $t \in \mathbf{Z}$ such that $H^i(E_U) = 0$ for $i < t$ and $U \in \text{Ob}(\mathcal{B})$.

Then there exists a solution unique up to unique isomorphism.

Proof. By Hypercoverings, Lemma 12.3 there exists a hypercovering L for the site \mathcal{D} such that $L_n = \{U_{n,i}\}_{i \in I_n}$ with $U_{n,i} \in \text{Ob}(\mathcal{B})$. Set $K = u(L)$. Apply Lemma 25.2 to get a cartesian object E of $D(\mathcal{O})$ on the site $(\mathcal{C}/K)_{total}$ restricting to $E_{U_{n,i}}$ on $\mathcal{C}/u(U_{n,i})$ compatibly. The assumption on t implies that $E \in D^+(\mathcal{O})$. By Hypercoverings, Lemma 12.4 we see that K is a hypercovering too. By Lemma 19.4 we find that $E = a^*F$ for some F in $D^+(\mathcal{O}_{\mathcal{C}})$.

To prove that F is a solution we will use the construction of L_0 and L_1 given in the proof of Hypercoverings, Lemma 12.3. (This is a bit inelegant but there does not seem to be a completely straightforward way around it.)

Namely, we have $I_0 = \text{Ob}(\mathcal{B})$ and so $L_0 = \{U\}_{U \in \text{Ob}(\mathcal{B})}$. Hence the isomorphism $a^*F \rightarrow E$ restricted to the components $\mathcal{C}/u(U)$ of \mathcal{C}/K_0 defines isomorphisms $\rho_U : F|_{\mathcal{C}/u(U)} \rightarrow E_U$ for $U \in \text{Ob}(\mathcal{B})$ by our choice of E .

To prove that ρ_U satisfy the requirement of compatibility with the maps ρ_a of Situation 25.1 we use that I_1 contains the set

$$\Omega = \{(U, V, W, a, b) \mid U, V, W \in \mathcal{B}, a : U \rightarrow V, b : U \rightarrow W\}$$

and that for $i = (U, V, W, a, b)$ in Ω we have $U_{1,i} = U$. Moreover, the component maps $f_{\delta_0^1, i}$ and $f_{\delta_1^1, i}$ of the two morphisms $K_1 \rightarrow K_0$ are the morphisms

$$a : U \rightarrow V \quad \text{and} \quad b : U \rightarrow W$$

Hence the compatibility mentioned in Lemma 25.2 gives that

$$\rho_a \circ \rho_V|_{\mathcal{C}/u(U)} = \rho_U \quad \text{and} \quad \rho_b \circ \rho_W|_{\mathcal{C}/u(U)} = \rho_U$$

Taking $i = (U, V, U, a, \text{id}_U) \in \Omega$ for example, we find that we have the desired compatibility. The uniqueness of F follows from the uniqueness of E in the previous lemma (small detail omitted). \square

0DCC **Lemma 25.4** (Unbounded BBD glueing lemma). *In Situation 25.1. Assume*

- (1) \mathcal{C} has equalizers and fibre products,
- (2) there is a morphism of sites $f : \mathcal{C} \rightarrow \mathcal{D}$ given by a continuous functor $u : \mathcal{D} \rightarrow \mathcal{C}$ such that
 - (a) \mathcal{D} has equalizers and fibre products and u commutes with them,
 - (b) \mathcal{B} is a full subcategory of \mathcal{D} and $u : \mathcal{B} \rightarrow \mathcal{C}$ is the restriction of u ,
 - (c) every object of \mathcal{D} has a covering whose members are objects of \mathcal{B} ,
- (3) all negative self-exts of E_U in $D(\mathcal{O}_{u(U)})$ are zero, and
- (4) there exist weak Serre subcategories $\mathcal{A}_U \subset \text{Mod}(\mathcal{O}_U)$ for all $U \in \text{Ob}(\mathcal{C})$ satisfying conditions (1), (2), and (3),
- (5) $E_U \in D_{\mathcal{A}_U}(\mathcal{O}_U)$.

Then there exists a solution unique up to unique isomorphism.

Proof. The proof is **exactly** the same as the proof of Lemma 25.3. The only change is that E is an object of $D_{\mathcal{A}_{\text{total}}}(\mathcal{O})$ and hence we use Lemma 24.3 to obtain F with $E = a^*F$ instead of Lemma 19.4. \square

26. Proper hypercoverings in topology

09XA Let's work in the category LC of Hausdorff and locally quasi-compact topological spaces and continuous maps, see Cohomology on Sites, Section 25. Let X be an object of LC and let U be a simplicial object of LC . Assume we have an augmentation

$$a : U \rightarrow X$$

We say that U is a *proper hypercovering* of X if

- (1) $U_0 \rightarrow X$ is a proper surjective map,
- (2) $U_1 \rightarrow U_0 \times_X U_0$ is a proper surjective map,
- (3) $U_{n+1} \rightarrow (\text{cosk}_n \text{sk}_n U)_{n+1}$ is a proper surjective map for $n \geq 1$.

The category LC has all finite limits, hence the coskeleta used in the formulation above exist.

Principle: Proper hypercoverings can be used to compute cohomology.

A key idea behind the proof of the principle is to find a topology on LC which is stronger than the usual one such that (a) a surjective proper map defines a covering, and (b) cohomology of usual sheaves with respect to this stronger topology agrees with the usual cohomology. Properties (a) and (b) hold for the qc topology, see Cohomology on Sites, Section 25. Once we have (a) and (b) we deduce the principle via the earlier work done in this chapter.

ODAF **Lemma 26.1.** *Let U be a simplicial object of LC and let $a : U \rightarrow X$ be an augmentation. There is a commutative diagram*

$$\begin{array}{ccc} Sh((LC_{qc}/U)_{total}) & \xrightarrow{h} & Sh(U_{Zar}) \\ a_{qc} \downarrow & & \downarrow a \\ Sh(LC_{qc}/X) & \xrightarrow{h_{-1}} & Sh(X) \end{array}$$

where the left vertical arrow is defined in Section 22 and the right vertical arrow is defined in Lemma 2.8.

Proof. Write $Sh(X) = Sh(X_{Zar})$. Observe that both $(LC_{qc}/U)_{total}$ and U_{Zar} fall into case A of Situation 3.3. This is immediate from the construction of U_{Zar} in Section 2 and it follows from Lemma 22.5 for $(LC_{qc}/U)_{total}$. Next, consider the functors $U_{n,Zar} \rightarrow LC_{qc}/U_n$, $U \mapsto U/U_n$ and $X_{Zar} \rightarrow LC_{qc}/X$, $U \mapsto U/X$. We have seen that these define morphisms of sites in Cohomology on Sites, Section 25. Thus we obtain a morphism of simplicial sites compatible with augmentations as in Remark 5.4 and we may apply Lemma 5.5 to conclude. \square

ODAG **Lemma 26.2.** *Let U be a simplicial object of LC and let $a : U \rightarrow X$ be an augmentation. If $a : U \rightarrow X$ gives a proper hypercovering of X , then*

$$a^{-1} : Sh(X) \rightarrow Sh(U_{Zar}) \quad \text{and} \quad a^{-1} : Ab(X) \rightarrow Ab(U_{Zar})$$

are fully faithful with essential image the cartesian sheaves and quasi-inverse given by a_* . Here $a : Sh(U_{Zar}) \rightarrow Sh(X)$ is as in Lemma 2.8.

Proof. We will prove the statement for sheaves of sets. It will be an almost formal consequence of results already established. Consider the diagram of Lemma 26.1. By Cohomology on Sites, Lemma 25.6 the functor $(h_{-1})^{-1}$ is fully faithful with quasi-inverse $h_{-1,*}$. The same holds true for the components h_n of h . By the description of the functors h^{-1} and h_* of Lemma 5.2 we conclude that h^{-1} is fully faithful with quasi-inverse h_* . Observe that U is a hypercovering of X in LC_{qc} (as defined in Section 22) by Cohomology on Sites, Lemma 25.4. By Lemma 22.1 we see that a_{qc}^{-1} is fully faithful with quasi-inverse $a_{qc,*}$ and with essential image the cartesian sheaves on $(LC_{qc}/U)_{total}$. A formal argument (chasing around the diagram) now shows that a^{-1} is fully faithful.

Finally, suppose that \mathcal{G} is a cartesian sheaf on U_{Zar} . Then $h^{-1}\mathcal{G}$ is a cartesian sheaf on LC_{qc}/U . Hence $h^{-1}\mathcal{G} = a_{qc}^{-1}\mathcal{H}$ for some sheaf \mathcal{H} on LC_{qc}/X . We compute

$$\begin{aligned}
(h_{-1})^{-1}(a_*\mathcal{G}) &= (h_{-1})^{-1}\text{Eq}(a_{0,*}\mathcal{G}_0 \rightrightarrows a_{1,*}\mathcal{G}_1) \\
&= \text{Eq}((h_{-1})^{-1}a_{0,*}\mathcal{G}_0 \rightrightarrows (h_{-1})^{-1}a_{1,*}\mathcal{G}_1) \\
&= \text{Eq}(a_{qc,0,*}h_0^{-1}\mathcal{G}_0 \rightrightarrows a_{qc,1,*}h_1^{-1}\mathcal{G}_1) \\
&= \text{Eq}(a_{qc,0,*}a_{qc,0}^{-1}\mathcal{H} \rightrightarrows a_{qc,1,*}a_{qc,1}^{-1}\mathcal{H}) \\
&= a_{qc,*}a_{qc}^{-1}\mathcal{H} \\
&= \mathcal{H}
\end{aligned}$$

Here the first equality follows from Lemma 2.8, the second equality follows as $(h_{-1})^{-1}$ is an exact functor, the third equality follows from Cohomology on Sites, Lemma 25.8 (here we use that $a_0 : U_0 \rightarrow X$ and $a_1 : U_1 \rightarrow X$ are proper), the fourth follows from $a_{qc}^{-1}\mathcal{H} = h^{-1}\mathcal{G}$, the fifth from Lemma 4.2, and the sixth we've seen above. Since $a_{qc}^{-1}\mathcal{H} = h^{-1}\mathcal{G}$ we deduce that $h^{-1}\mathcal{G} \cong h^{-1}a^{-1}a_*\mathcal{G}$ which ends the proof by fully faithfulness of h^{-1} . \square

09XS **Lemma 26.3.** *Let U be a simplicial object of LC and let $a : U \rightarrow X$ be an augmentation. If $a : U \rightarrow X$ gives a proper hypercovering of X , then for $K \in D^+(X)$*

$$K \rightarrow Ra_*(a^{-1}K)$$

is an isomorphism where $a : Sh(U_{Zar}) \rightarrow Sh(X)$ is as in Lemma 2.8.

Proof. Consider the diagram of Lemma 26.1. Observe that $Rh_{n,*}h_n^{-1}$ is the identity functor on $D^+(U_n)$ by Cohomology on Sites, Lemma 25.13. Hence Rh_*h^{-1} is the identity functor on $D^+(U_{Zar})$ by Lemma 5.3. We have

$$\begin{aligned}
Ra_*(a^{-1}K) &= Ra_*Rh_*h^{-1}a^{-1}K \\
&= Rh_{-1,*}Ra_{qc,*}a_{qc}^{-1}(h_{-1})^{-1}K \\
&= Rh_{-1,*}(h_{-1})^{-1}K \\
&= K
\end{aligned}$$

The first equality by the discussion above, the second equality because of the commutativity of the diagram in Lemma 26.1, the third equality by Lemma 22.2 (U is a hypercovering of X in LC_{qc} by Cohomology on Sites, Lemma 25.4), and the last equality by the already used Cohomology on Sites, Lemma 25.13. \square

09XC **Lemma 26.4.** *Let U be a simplicial object of LC and let $a : U \rightarrow X$ be an augmentation. If U is a proper hypercovering of X , then*

$$R\Gamma(X, K) = R\Gamma(U_{Zar}, a^{-1}K)$$

for $K \in D^+(X)$ where $a : Sh(U_{Zar}) \rightarrow Sh(X)$ is as in Lemma 2.8.

Proof. This follows from Lemma 26.3 because $R\Gamma(U_{Zar}, -) = R\Gamma(X, -) \circ Ra_*$ by Cohomology on Sites, Remark 15.4. \square

0DAH **Lemma 26.5.** *Let U be a simplicial object of LC and let $a : U \rightarrow X$ be an augmentation. Let $\mathcal{A} \subset Ab(U_{Zar})$ denote the weak Serre subcategory of cartesian*

abelian sheaves. If U is a proper hypercovering of X , then the functor a^{-1} defines an equivalence

$$D^+(X) \longrightarrow D_{\mathcal{A}}^+(U_{Zar})$$

with quasi-inverse Ra_* where $a : Sh(U_{Zar}) \rightarrow Sh(X)$ is as in Lemma 2.8.

Proof. Observe that \mathcal{A} is a weak Serre subcategory by Lemma 12.6. The equivalence is a formal consequence of the results obtained so far. Use Lemmas 13.5, 26.2, and 26.3. \square

09XB **Lemma 26.6.** *Let U be a simplicial object of LC and let $a : U \rightarrow X$ be an augmentation. Let \mathcal{F} be an abelian sheaf on X . Let \mathcal{F}_n be the pullback to U_n . If U is a proper hypercovering of X , then there exists a canonical spectral sequence*

$$E_1^{p,q} = H^q(U_p, \mathcal{F}_p)$$

converging to $H^{p+q}(X, \mathcal{F})$.

Proof. Immediate consequence of Lemmas 26.4 and 2.10. \square

27. Simplicial schemes

09XT A *simplicial scheme* is a simplicial object in the category of schemes, see Simplicial, Definition 3.1. Recall that a simplicial scheme looks like

$$X_2 \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} X_1 \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} X_0$$

Here there are two morphisms $d_0^1, d_1^1 : X_1 \rightarrow X_0$ and a single morphism $s_0^0 : X_0 \rightarrow X_1$, etc. These morphisms satisfy some required relations such as $d_0^1 \circ s_0^0 = \text{id}_{X_0} = d_1^1 \circ s_0^0$, see Simplicial, Lemma 3.2. It is useful to think of $d_i^n : X_n \rightarrow X_{n-1}$ as the “projection forgetting the i th coordinate” and to think of $s_j^n : X_n \rightarrow X_{n+1}$ as the “diagonal map repeating the j th coordinate”.

A *morphism of simplicial schemes* $h : X \rightarrow Y$ is the same thing as a morphism of simplicial objects in the category of schemes, see Simplicial, Definition 3.1. Thus h consists of morphisms of schemes $h_n : X_n \rightarrow Y_n$ such that $h_{n-1} \circ d_j^n = d_j^n \circ h_n$ and $h_{n+1} \circ s_j^n = s_j^n \circ h_n$ whenever this makes sense.

An *augmentation* of a simplicial scheme X is a morphism of schemes $a_0 : X_0 \rightarrow S$ such that $a_0 \circ d_0^1 = a_0 \circ d_1^1$. See Simplicial, Section 20.

Let X be a simplicial scheme. The construction of Section 2 applied to the underlying simplicial topological space gives a site X_{Zar} . On the other hand, for every n we have the small Zariski site $X_{n,Zar}$ (Topologies, Definition 3.7) and for every morphism $\varphi : [m] \rightarrow [n]$ we have a morphism of sites $f_\varphi = X(\varphi)_{small} : X_{n,Zar} \rightarrow X_{m,Zar}$, associated to the morphism of schemes $X(\varphi) : X_n \rightarrow X_m$ (Topologies, Lemma 3.16). This gives a simplicial object \mathcal{C} in the category of sites. In Lemma 3.1 we constructed an associated site \mathcal{C}_{total} . Assigning to an open immersion its image defines an equivalence $\mathcal{C}_{total} \rightarrow X_{Zar}$ which identifies sheaves, i.e., $Sh(\mathcal{C}_{total}) = Sh(X_{Zar})$. The difference between \mathcal{C}_{total} and X_{Zar} is similar to the difference between the small Zariski site S_{Zar} and the underlying topological space of S . We will silently identify these sites in what follows.

Let X_{Zar} be the site associated to a simplicial scheme X . There is a sheaf of rings \mathcal{O} on X_{Zar} whose restriction to X_n is the structure sheaf \mathcal{O}_{X_n} . This follows from Lemma 2.2 or from Lemma 3.4. We will say \mathcal{O} is the *structure sheaf of the*

simplicial scheme X . At this point all the material developed for simplicial (ringed) sites applies, see Sections 3, 4, 5, 6, 8, 9, 10, 11, 12, 14, and 15.

Let X be a simplicial scheme with structure sheaf \mathcal{O} . As on any ringed topos, there is a notion of a *quasi-coherent \mathcal{O} -module on X_{Zar}* , see Modules on Sites, Definition 23.1. However, a quasi-coherent \mathcal{O} -module on X_{Zar} is just a cartesian \mathcal{O} -module \mathcal{F} whose restrictions \mathcal{F}_n are quasi-coherent on X_n , see Lemma 12.10.

Let $h : X \rightarrow Y$ be a morphism of simplicial schemes. Either by Lemma 2.3 or by (the proof of) Lemma 5.2 we obtain a morphism of sites $h_{Zar} : X_{Zar} \rightarrow Y_{Zar}$. Recall that h_{Zar}^{-1} and $h_{Zar,*}$ have a simple description in terms of the components, see Lemma 2.4 or Lemma 5.2. Let \mathcal{O}_X , resp. \mathcal{O}_Y denote the structure sheaf of X , resp. Y . We define $h_{Zar}^\sharp : h_{Zar,*}\mathcal{O}_X \rightarrow \mathcal{O}_Y$ to be the map of sheaves of rings on Y_{Zar} given by $h_n^\sharp : h_{n,*}\mathcal{O}_{X_n} \rightarrow \mathcal{O}_{Y_n}$ on Y_n . We obtain a morphism of ringed sites

$$h_{Zar} : (X_{Zar}, \mathcal{O}_X) \longrightarrow (Y_{Zar}, \mathcal{O}_Y)$$

Let X be a simplicial scheme with structure sheaf \mathcal{O} . Let S be a scheme and let $a_0 : X_0 \rightarrow S$ be an augmentation of X . Either by Lemma 2.8 or by Lemma 4.2 we obtain a corresponding morphism of topoi $a : Sh(X_{Zar}) \rightarrow Sh(S)$. Observe that $a^{-1}\mathcal{G}$ is the sheaf on X_{Zar} with components $a_n^{-1}\mathcal{G}$. Hence we can use the maps $a_n^\sharp : a_n^{-1}\mathcal{O}_S \rightarrow \mathcal{O}_{X_n}$ to define a map $a^\sharp : a^{-1}\mathcal{O}_S \rightarrow \mathcal{O}$, or equivalently by adjunction a map $a^\sharp : \mathcal{O}_S \rightarrow a_*\mathcal{O}$ (which as usual has the same name). This puts us in the situation discussed in Section 11. Therefore we obtain a morphism of ringed topoi

$$a : (Sh(X_{Zar}), \mathcal{O}) \longrightarrow (Sh(S), \mathcal{O}_S)$$

A final observation is the following. Suppose we are given a morphism $h : X \rightarrow Y$ of simplicial schemes X and Y with structure sheaves $\mathcal{O}_X, \mathcal{O}_Y$, augmentations $a_0 : X_0 \rightarrow X_{-1}, b_0 : Y_0 \rightarrow Y_{-1}$ and a morphism $h_{-1} : X_{-1} \rightarrow Y_{-1}$ such that

$$\begin{array}{ccc} X_0 & \xrightarrow{\quad} & Y_0 \\ a_0 \downarrow & & \downarrow b_0 \\ X_{-1} & \xrightarrow{\quad} & Y_{-1} \end{array}$$

commutes. Then from the constructions elucidated above we obtain a commutative diagram of morphisms of ringed topoi as follows

$$\begin{array}{ccc} (Sh(X_{Zar}), \mathcal{O}_X) & \xrightarrow{\quad} & (Sh(Y_{Zar}), \mathcal{O}_Y) \\ a \downarrow & & \downarrow b \\ (Sh(X_{-1}), \mathcal{O}_{X_{-1}}) & \xrightarrow{\quad} & (Sh(Y_{-1}), \mathcal{O}_{Y_{-1}}) \end{array}$$

28. Descent in terms of simplicial schemes

0248 Cartesian morphisms are defined as follows.

0249 **Definition 28.1.** Let $a : Y \rightarrow X$ be a morphism of simplicial schemes. We say a is *cartesian*, or that Y is *cartesian over X* , if for every morphism $\varphi : [n] \rightarrow [m]$ of

Δ the corresponding diagram

$$\begin{array}{ccc} Y_m & \xrightarrow{a} & X_m \\ Y(\varphi) \downarrow & & \downarrow X(\varphi) \\ Y_n & \xrightarrow{a} & X_n \end{array}$$

is a fibre square in the category of schemes.

Cartesian morphisms are related to descent data. First we prove a general lemma describing the category of cartesian simplicial schemes over a fixed simplicial scheme. In this lemma we denote $f^* : Sch/X \rightarrow Sch/Y$ the base change functor associated to a morphism of schemes $f : Y \rightarrow X$.

07TC **Lemma 28.2.** *Let X be a simplicial scheme. The category of simplicial schemes cartesian over X is equivalent to the category of pairs (V, φ) where V is a scheme over X_0 and*

$$\varphi : V \times_{X_0, d_1^1} X_1 \longrightarrow X_1 \times_{d_0^1, X_0} V$$

is an isomorphism over X_1 such that $(s_0^0)^* \varphi = id_V$ and such that

$$(d_1^2)^* \varphi = (d_0^2)^* \varphi \circ (d_2^2)^* \varphi$$

as morphisms of schemes over X_2 .

Proof. The statement of the displayed equality makes sense because $d_1^1 \circ d_2^2 = d_1^1 \circ d_1^2$, $d_1^1 \circ d_0^2 = d_0^1 \circ d_2^2$, and $d_0^1 \circ d_0^2 = d_0^1 \circ d_1^2$ as morphisms $X_2 \rightarrow X_0$, see Simplicial, Remark 3.3 hence we can picture these maps as follows

$$\begin{array}{ccc} & X_2 \times_{d_1^1 \circ d_0^2, X_0} V \xrightarrow{(d_0^2)^* \varphi} X_2 \times_{d_0^1 \circ d_0^2, X_0} V & \\ & \parallel & \parallel \\ X_2 \times_{d_0^1 \circ d_2^2, X_0} V & & X_2 \times_{d_0^1 \circ d_1^2, X_0} V \\ & \xleftarrow{(d_2^2)^* \varphi} & \xrightarrow{(d_1^2)^* \varphi} \\ & X_2 \times_{d_1^1 \circ d_2^2, X_0} V = X_2 \times_{d_1^1 \circ d_1^2, X_0} V & \end{array}$$

and the condition signifies the diagram is commutative. It is clear that given a simplicial scheme Y cartesian over X we can set $V = Y_0$ and φ equal to the composition

$$V \times_{X_0, d_1^1} X_1 = Y_0 \times_{X_0, d_1^1} X_1 = Y_1 = X_1 \times_{X_0, d_0^1} Y_0 = X_1 \times_{X_0, d_0^1} V$$

of identifications given by the cartesian structure. To prove this functor is an equivalence we construct a quasi-inverse. The construction of the quasi-inverse is analogous to the construction discussed in Descent, Section 3 from which we borrow the notation $\tau_i^n : [0] \rightarrow [n]$, $0 \mapsto i$ and $\tau_{ij}^n : [1] \rightarrow [n]$, $0 \mapsto i$, $1 \mapsto j$. Namely, given a pair (V, φ) as in the lemma we set $Y_n = X_n \times_{X(\tau_n^n), X_0} V$. Then given $\beta : [n] \rightarrow [m]$ we define $V(\beta) : Y_m \rightarrow Y_n$ as the pullback by $X(\tau_{\beta(n)m}^m)$ of the map φ postcomposed by the projection $X_m \times_{X(\beta), X_n} Y_n \rightarrow Y_n$. This makes sense because

$$X_m \times_{X(\tau_{\beta(n)m}^m), X_1} X_1 \times_{d_1^1, X_0} V = X_m \times_{X(\tau_m^m), X_0} V = Y_m$$

and

$$X_m \times_{X(\tau_{\beta(n)m}^m), X_1} X_1 \times_{d_0^1, X_0} V = X_m \times_{X(\tau_{\beta(n)}^m), X_0} V = X_m \times_{X(\beta), X_n} Y_n.$$

We omit the verification that the commutativity of the displayed diagram above implies the maps compose correctly. We also omit the verification that the two functors are quasi-inverse to each other. \square

024A **Definition 28.3.** Let $f : X \rightarrow S$ be a morphism of schemes. The *simplicial scheme associated to f* , denoted $(X/S)_\bullet$, is the functor $\Delta^{opp} \rightarrow Sch$, $[n] \mapsto X \times_S \dots \times_S X$ described in *Simplicial*, Example 3.5.

Thus $(X/S)_n$ is the $(n + 1)$ -fold fibre product of X over S . The morphism $d_0^1 : X \times_S X \rightarrow X$ is the map $(x_0, x_1) \mapsto x_1$ and the morphism d_1^1 is the other projection. The morphism s_0^0 is the diagonal morphism $X \rightarrow X \times_S X$.

024B **Lemma 28.4.** Let $f : X \rightarrow S$ be a morphism of schemes. Let $\pi : Y \rightarrow (X/S)_\bullet$ be a cartesian morphism of simplicial schemes. Set $V = Y_0$ considered as a scheme over X . The morphisms $d_0^1, d_1^1 : Y_1 \rightarrow Y_0$ and the morphism $\pi_1 : Y_1 \rightarrow X \times_S X$ induce isomorphisms

$$V \times_S X \xleftarrow{(d_1^1, \pi_1 \circ \pi_1)} Y_1 \xrightarrow{(\pi_0 \circ \pi_1, d_0^1)} X \times_S V.$$

Denote $\varphi : V \times_S X \rightarrow X \times_S V$ the resulting isomorphism. Then the pair (V, φ) is a descent datum relative to $X \rightarrow S$.

Proof. This is a special case of (part of) Lemma 28.2 as the displayed equation of that lemma is equivalent to the cocycle condition of Descent, Definition 31.1. \square

024C **Lemma 28.5.** Let $f : X \rightarrow S$ be a morphism of schemes. The construction

$$\begin{array}{ccc} \text{category of cartesian} & \longrightarrow & \text{category of descent data} \\ \text{schemes over } (X/S)_\bullet & & \text{relative to } X/S \end{array}$$

of Lemma 28.4 is an equivalence of categories.

Proof. The functor from left to right is given in Lemma 28.4. Hence this is a special case of Lemma 28.2. \square

We may reinterpret the pullback of Descent, Lemma 31.6 as follows. Suppose given a morphism of simplicial schemes $f : X' \rightarrow X$ and a cartesian morphism of simplicial schemes $Y \rightarrow X$. Then the fibre product (viewed as a ‘‘pullback’’)

$$f^*Y = Y \times_X X'$$

of simplicial schemes is a simplicial scheme cartesian over X' . Suppose given a commutative diagram of morphisms of schemes

$$\begin{array}{ccc} X' & \longrightarrow & X \\ \downarrow & & \downarrow \\ S' & \longrightarrow & S. \end{array}$$

This gives rise to a morphism of simplicial schemes

$$f_\bullet : (X'/S')_\bullet \longrightarrow (X/S)_\bullet.$$

We claim that the ‘‘pullback’’ f_\bullet^* along the morphism $f_\bullet : (X'/S')_\bullet \rightarrow (X/S)_\bullet$ corresponds via Lemma 28.5 with the pullback defined in terms of descent data in the aforementioned Descent, Lemma 31.6.

29. Quasi-coherent modules on simplicial schemes

07TE

07TI Lemma 29.1. *Let $f : V \rightarrow U$ be a morphism of simplicial schemes. Given a quasi-coherent module \mathcal{F} on U_{Zar} the pullback $f^*\mathcal{F}$ is a quasi-coherent module on V_{Zar} .*

Proof. Recall that \mathcal{F} is cartesian with \mathcal{F}_n quasi-coherent, see Lemma 12.10. By Lemma 2.4 we see that $(f^*\mathcal{F})_n = f_n^*\mathcal{F}_n$ (some details omitted). Hence $(f^*\mathcal{F})_n$ is quasi-coherent. The same fact and the cartesian property for \mathcal{F} imply the cartesian property for $f^*\mathcal{F}$. Thus \mathcal{F} is quasi-coherent by Lemma 12.10 again. \square

07TJ Lemma 29.2. *Let $f : V \rightarrow U$ be a cartesian morphism of simplicial schemes. Assume the morphisms $d_j^n : U_n \rightarrow U_{n-1}$ are flat and the morphisms $V_n \rightarrow U_n$ are quasi-compact and quasi-separated. For a quasi-coherent module \mathcal{G} on V_{Zar} the pushforward $f_*\mathcal{G}$ is a quasi-coherent module on U_{Zar} .*

Proof. If $\mathcal{F} = f_*\mathcal{G}$, then $\mathcal{F}_n = f_{n,*}\mathcal{G}_n$ by Lemma 2.4. The maps $\mathcal{F}(\varphi)$ are defined using the base change maps, see Cohomology, Section 18. The sheaves \mathcal{F}_n are quasi-coherent by Schemes, Lemma 24.1 and the fact that \mathcal{G}_n is quasi-coherent by Lemma 12.10. The base change maps along the degeneracies d_j^n are isomorphisms by Cohomology of Schemes, Lemma 5.2 and the fact that \mathcal{G} is cartesian by Lemma 12.10. Hence \mathcal{F} is cartesian by Lemma 12.2. Thus \mathcal{F} is quasi-coherent by Lemma 12.10. \square

07TK Lemma 29.3. *Let $f : V \rightarrow U$ be a cartesian morphism of simplicial schemes. Assume the morphisms $d_j^n : U_n \rightarrow U_{n-1}$ are flat and the morphisms $V_n \rightarrow U_n$ are quasi-compact and quasi-separated. Then f^* and f_* form an adjoint pair of functors between the categories of quasi-coherent modules on U_{Zar} and V_{Zar} .*

Proof. We have seen in Lemmas 29.1 and 29.2 that the statement makes sense. The adjointness property follows immediately from the fact that each f_n^* is adjoint to $f_{n,*}$. \square

07TL Lemma 29.4. *Let $f : X \rightarrow S$ be a morphism of schemes which has a section⁵. Let $(X/S)_\bullet$ be the simplicial scheme associated to $X \rightarrow S$, see Definition 28.3. Then pullback defines an equivalence between the category of quasi-coherent \mathcal{O}_S -modules and the category of quasi-coherent modules on $((X/S)_\bullet)_{Zar}$.*

Proof. Let $\sigma : S \rightarrow X$ be a section of f . Let (\mathcal{F}, α) be a pair as in Lemma 12.5. Set $\mathcal{G} = \sigma^*\mathcal{F}$. Consider the diagram

$$\begin{array}{ccccc} X & \xrightarrow{\quad} & X \times_S X & \xrightarrow{\quad} & X \\ & & \downarrow \text{pr}_0 & & \downarrow \text{pr}_1 \\ f \downarrow & & S & \xrightarrow{\quad \sigma \quad} & X \end{array}$$

Note that $\text{pr}_0 = d_1^1$ and $\text{pr}_1 = d_0^1$. Hence we see that $(\sigma \circ f, 1)^*\alpha$ defines an isomorphism

$$f^*\mathcal{G} = (\sigma \circ f, 1)^*\text{pr}_0^*\mathcal{F} \longrightarrow (\sigma \circ f, 1)^*\text{pr}_1^*\mathcal{F} = \mathcal{F}$$

⁵In fact, it would be enough to assume that f has fpqc locally on S a section, since we have descent of quasi-coherent modules by Descent, Section 5.

We omit the verification that this isomorphism is compatible with α and the canonical isomorphism $\mathrm{pr}_0^* f^* \mathcal{G} \rightarrow \mathrm{pr}_1^* f^* \mathcal{G}$. \square

30. Groupoids and simplicial schemes

07TM Given a groupoid in schemes we can build a simplicial scheme. It will turn out that the category of quasi-coherent sheaves on a groupoid is equivalent to the category of cartesian quasi-coherent sheaves on the associated simplicial scheme.

07TN **Lemma 30.1.** *Let (U, R, s, t, c, e, i) be a groupoid scheme over S . There exists a simplicial scheme X over S with the following properties*

- (1) $X_0 = U$, $X_1 = R$, $X_2 = R \times_{s,U,t} R$,
- (2) $s_0^0 = e : X_0 \rightarrow X_1$,
- (3) $d_0^1 = s : X_1 \rightarrow X_0$, $d_1^1 = t : X_1 \rightarrow X_0$,
- (4) $s_0^1 = (e \circ t, 1) : X_1 \rightarrow X_2$, $s_1^1 = (1, e \circ t) : X_1 \rightarrow X_2$,
- (5) $d_0^2 = \mathrm{pr}_1 : X_2 \rightarrow X_1$, $d_1^2 = c : X_2 \rightarrow X_1$, $d_2^2 = \mathrm{pr}_0$, and
- (6) $X = \mathrm{cosk}_2 \mathrm{sk}_2 X$.

For all n we have $X_n = R \times_{s,U,t} \dots \times_{s,U,t} R$ with n factors. The map $d_j^n : X_n \rightarrow X_{n-1}$ is given on functors of points by

$$(r_1, \dots, r_n) \mapsto (r_1, \dots, c(r_j, r_{j+1}), \dots, r_n)$$

for $1 \leq j \leq n-1$ whereas $d_0^n(r_1, \dots, r_n) = (r_2, \dots, r_n)$ and $d_n^n(r_1, \dots, r_n) = (r_1, \dots, r_{n-1})$.

Proof. We only have to verify that the rules prescribed in (1), (2), (3), (4), (5) define a 2-truncated simplicial scheme U' over S , since then (6) allows us to set $X = \mathrm{cosk}_2 U'$, see *Simplicial*, Lemma 19.2. Using the functor of points approach, all we have to verify is that if $(\mathrm{Ob}, \mathrm{Arrows}, s, t, c, e, i)$ is a groupoid, then

$$\begin{array}{ccc} \mathrm{Arrows} \times_{s, \mathrm{Ob}, t} \mathrm{Arrows} & & \\ \mathrm{pr}_1 \downarrow \uparrow 1, e & c \downarrow \uparrow e, 1 & \mathrm{pr}_0 \downarrow \uparrow \\ \mathrm{Arrows} & & \\ s \downarrow \uparrow e & & t \downarrow \uparrow \\ \mathrm{Ob} & & \end{array}$$

is a 2-truncated simplicial set. We omit the details.

Finally, the description of X_n for $n > 2$ follows by induction from the description of X_0 , X_1 , X_2 , and *Simplicial*, Remark 19.9 and Lemma 19.6. Alternately, one shows that cosk_2 applied to the 2-truncated simplicial set displayed above gives a simplicial set whose n th term equals $\mathrm{Arrows} \times_{s, \mathrm{Ob}, t} \dots \times_{s, \mathrm{Ob}, t} \mathrm{Arrows}$ with n factors and degeneracy maps as given in the lemma. Some details omitted. \square

07TP **Lemma 30.2.** *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S . Let X be the simplicial scheme over S constructed in Lemma 30.1. Then the category of quasi-coherent modules on (U, R, s, t, c) is equivalent to the category of quasi-coherent modules on X_{Zar} .*

Proof. This is clear from Lemmas 12.10 and 12.5 and *Groupoids*, Definition 14.1. \square

In the following lemma we will use the concept of a cartesian morphism $V \rightarrow U$ of simplicial schemes as defined in Definition 28.1.

07TQ **Lemma 30.3.** *Let (U, R, s, t, c) be a groupoid scheme over a scheme S . Let X be the simplicial scheme over S constructed in Lemma 30.1. Let $(R/U)_\bullet$ be the simplicial scheme associated to $s : R \rightarrow U$, see Definition 28.3. There exists a cartesian morphism $t_\bullet : (R/U)_\bullet \rightarrow X$ of simplicial schemes with low degree morphisms given by*

$$\begin{array}{ccccccc}
 R \times_{s,U,s} R & \times_{s,U,s} R & \xrightarrow{\text{pr}_{12}} & R & \xrightarrow{\text{pr}_1} & R & \xrightarrow{\text{pr}_0} & R \\
 \downarrow (r_0, r_1, r_2) \mapsto (r_0 \circ r_1^{-1}, r_1 \circ r_2^{-1}) & & \xrightarrow{\text{pr}_{02}} & \downarrow (r_0, r_1) \mapsto r_0 \circ r_1^{-1} & & \downarrow t & & \\
 R \times_{s,U,t} R & \xrightarrow{\text{pr}_1} & R & \xrightarrow{s} & U & & & \\
 & \xrightarrow{c} & & \xrightarrow{t} & & & & \\
 & \xrightarrow{\text{pr}_0} & & & & & &
 \end{array}$$

Proof. For arbitrary n we define $(R/U)_\bullet \rightarrow X_n$ by the rule

$$(r_0, \dots, r_n) \longrightarrow (r_0 \circ r_1^{-1}, \dots, r_{n-1} \circ r_n^{-1})$$

Compatibility with degeneracy maps is clear from the description of the degeneracies in Lemma 30.1. We omit the verification that the maps respect the morphisms s_j^n . Groupoids, Lemma 13.5 (with the roles of s and t reversed) shows that the two right squares are cartesian. In exactly the same manner one shows all the other squares are cartesian too. Hence the morphism is cartesian. \square

31. Descent data give equivalence relations

024D In Section 28 we saw how descent data relative to $X \rightarrow S$ can be formulated in terms of cartesian simplicial schemes over $(X/S)_\bullet$. Here we link this to equivalence relations as follows.

024E **Lemma 31.1.** *Let $f : X \rightarrow S$ be a morphism of schemes. Let $\pi : Y \rightarrow (X/S)_\bullet$ be a cartesian morphism of simplicial schemes, see Definitions 28.1 and 28.3. Then the morphism*

$$j = (d_1^1, d_0^1) : Y_1 \rightarrow Y_0 \times_S Y_0$$

defines an equivalence relation on Y_0 over S , see Groupoids, Definition 3.1.

Proof. Note that j is a monomorphism. Namely the composition $Y_1 \rightarrow Y_0 \times_S Y_0 \rightarrow Y_0 \times_S X$ is an isomorphism as π is cartesian.

Consider the morphism

$$(d_2^2, d_0^2) : Y_2 \rightarrow Y_1 \times_{d_0^1, Y_0, d_1^1} Y_1.$$

This works because $d_0 \circ d_2 = d_1 \circ d_0$, see Simplicial, Remark 3.3. Also, it is a morphism over $(X/S)_2$. It is an isomorphism because $Y \rightarrow (X/S)_\bullet$ is cartesian. Note for example that the right hand side is isomorphic to $Y_0 \times_{\pi_0, X, \text{pr}_1} (X \times_S X \times_S X) = X \times_S Y_0 \times_S X$ because π is cartesian. Details omitted.

As in Groupoids, Definition 3.1 we denote $t = \text{pr}_0 \circ j = d_1^1$ and $s = \text{pr}_1 \circ j = d_0^1$. The isomorphism above, combined with the morphism $d_1^2 : Y_2 \rightarrow Y_1$ give us a composition morphism

$$c : Y_1 \times_{s, Y_0, t} Y_1 \longrightarrow Y_1$$

over $Y_0 \times_S Y_0$. This immediately implies that for any scheme T/S the relation $Y_1(T) \subset Y_0(T) \times Y_0(T)$ is transitive.

Reflexivity follows from the fact that the restriction of the morphism j to the diagonal $\Delta : X \rightarrow X \times_S X$ is an isomorphism (again use the cartesian property of π).

To see symmetry we consider the morphism

$$(d_2^2, d_1^2) : Y_2 \rightarrow Y_1 \times_{d_1^1, Y_0, d_1^1} Y_1.$$

This works because $d_1 \circ d_2 = d_1 \circ d_1$, see *Simplicial*, Remark 3.3. It is an isomorphism because $Y \rightarrow (X/S)_\bullet$ is cartesian. Note for example that the right hand side is isomorphic to $Y_0 \times_{\pi_0, X, \text{pr}_0} (X \times_S X \times_S X) = Y_0 \times_S X \times_S X$ because π is cartesian. Details omitted.

Let T/S be a scheme. Let $a \sim b$ for $a, b \in Y_0(T)$ be synonymous with $(a, b) \in Y_1(T)$. The isomorphism (d_2^2, d_1^2) above implies that if $a \sim b$ and $a \sim c$, then $b \sim c$. Combined with reflexivity this shows that \sim is an equivalence relation. \square

32. An example case

024F In this section we show that disjoint unions of spectra of Artinian rings can be descended along a quasi-compact surjective flat morphism of schemes.

024G **Lemma 32.1.** *Let $X \rightarrow S$ be a morphism of schemes. Suppose $Y \rightarrow (X/S)_\bullet$ is a cartesian morphism of simplicial schemes. For $y \in Y_0$ a point define*

$$T_y = \{y' \in Y_0 \mid \exists y_1 \in Y_1 : d_1^1(y_1) = y, d_0^1(y_1) = y'\}$$

as a subset of Y_0 . Then $y \in T_y$ and $T_y \cap T_{y'} \neq \emptyset \Rightarrow T_y = T_{y'}$.

Proof. Combine Lemma 31.1 and *Groupoids*, Lemma 3.4. \square

024H **Lemma 32.2.** *Let $X \rightarrow S$ be a morphism of schemes. Suppose $Y \rightarrow (X/S)_\bullet$ is a cartesian morphism of simplicial schemes. Let $y \in Y_0$ be a point. If $X \rightarrow S$ is quasi-compact, then*

$$T_y = \{y' \in Y_0 \mid \exists y_1 \in Y_1 : d_1^1(y_1) = y, d_0^1(y_1) = y'\}$$

is a quasi-compact subset of Y_0 .

Proof. Let F_y be the scheme theoretic fibre of $d_1^1 : Y_1 \rightarrow Y_0$ at y . Then we see that T_y is the image of the morphism

$$\begin{array}{ccc} F_y & \longrightarrow & Y_1 \xrightarrow{d_0^1} Y_0 \\ \downarrow & & \downarrow d_1^1 \\ y & \longrightarrow & Y_0 \end{array}$$

Note that F_y is quasi-compact. This proves the lemma. \square

024I **Lemma 32.3.** *Let $X \rightarrow S$ be a quasi-compact flat surjective morphism. Let (V, φ) be a descent datum relative to $X \rightarrow S$. If V is a disjoint union of spectra of Artinian rings, then (V, φ) is effective.*

Proof. Let $Y \rightarrow (X/S)_\bullet$ be the cartesian morphism of simplicial schemes corresponding to (V, φ) by Lemma 28.5. Observe that $Y_0 = V$. Write $V = \prod_{i \in I} \text{Spec}(A_i)$ with each A_i local Artinian. Moreover, let $v_i \in V$ be the unique closed point of $\text{Spec}(A_i)$ for all $i \in I$. Write $i \sim j$ if and only if $v_i \in T_{v_j}$ with notation as in Lemma 32.1 above. By Lemmas 32.1 and 32.2 this is an equivalence relation with finite equivalence classes. Let $\bar{I} = I / \sim$. Then we can write $V = \prod_{\bar{i} \in \bar{I}} V_{\bar{i}}$ with $V_{\bar{i}} = \prod_{i \in \bar{i}} \text{Spec}(A_i)$. By construction we see that $\varphi : V \times_S X \rightarrow X \times_S V$ maps the open and closed subspaces $V_{\bar{i}} \times_S X$ into the open and closed subspaces $X \times_S V_{\bar{i}}$. In other words, we get descent data $(V_{\bar{i}}, \varphi_{\bar{i}})$, and (V, φ) is the coproduct of them in the category of descent data. Since each of the $V_{\bar{i}}$ is a finite union of spectra of Artinian local rings the morphism $V_{\bar{i}} \rightarrow X$ is affine, see Morphisms, Lemma 11.13. Since $\{X \rightarrow S\}$ is an fpqc covering we see that all the descent data $(V_{\bar{i}}, \varphi_{\bar{i}})$ are effective by Descent, Lemma 34.1. \square

To be sure, the lemma above has very limited applicability!

33. Simplicial algebraic spaces

ODE7 Let S be a scheme. A *simplicial algebraic space* is a simplicial object in the category of algebraic spaces over S , see Simplicial, Definition 3.1. Recall that a simplicial algebraic space looks like

$$X_2 \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} X_1 \begin{array}{c} \xrightarrow{\quad} \\ \xleftarrow{\quad} \\ \xrightarrow{\quad} \\ \xleftarrow{\quad} \end{array} X_0$$

Here there are two morphisms $d_0^1, d_1^1 : X_1 \rightarrow X_0$ and a single morphism $s_0^0 : X_0 \rightarrow X_1$, etc. These morphisms satisfy some required relations such as $d_0^1 \circ s_0^0 = \text{id}_{X_0} = d_1^1 \circ s_0^0$, see Simplicial, Lemma 3.2. It is useful to think of $d_i^n : X_n \rightarrow X_{n-1}$ as the “projection forgetting the i th coordinate” and to think of $s_j^n : X_n \rightarrow X_{n+1}$ as the “diagonal map repeating the j th coordinate”.

A *morphism of simplicial algebraic spaces* $h : X \rightarrow Y$ is the same thing as a morphism of simplicial objects in the category of algebraic spaces over S , see Simplicial, Definition 3.1. Thus h consists of morphisms of algebraic spaces $h_n : X_n \rightarrow Y_n$ such that $h_{n-1} \circ d_j^n = d_j^n \circ h_n$ and $h_{n+1} \circ s_j^n = s_j^n \circ h_n$ whenever this makes sense.

An *augmentation* $a : X \rightarrow X_{-1}$ of a simplicial algebraic space X is given by a morphism of algebraic spaces $a_0 : X_0 \rightarrow X_{-1}$ such that $a_0 \circ d_0^1 = a_0 \circ d_1^1$. See Simplicial, Section 20. In this situation we always indicate $a_n : X_n \rightarrow X_{-1}$ the induced morphisms for $n \geq 0$.

Let X be a simplicial algebraic space. For every n we have the site $X_{n, \text{spaces}, \text{étale}}$ (Properties of Spaces, Definition 18.2) and for every morphism $\varphi : [m] \rightarrow [n]$ we have a morphism of sites

$$f_\varphi = X(\varphi)_{\text{spaces}, \text{étale}} : X_{n, \text{spaces}, \text{étale}} \rightarrow X_{m, \text{spaces}, \text{étale}},$$

associated to the morphism of algebraic spaces $X(\varphi) : X_n \rightarrow X_m$ (Properties of Spaces, Lemma 18.7). This gives a simplicial object in the category of sites. In Lemma 3.1 we constructed an associated site which we denote $X_{\text{spaces}, \text{étale}}$. An object of the site $X_{\text{spaces}, \text{étale}}$ is an algebraic space U étale over X_n for some n and a morphism $(\varphi, f) : U/X_n \rightarrow V/X_m$ is given by a morphism $\varphi : [m] \rightarrow [n]$ in

Δ and a morphism $f : U \rightarrow V$ of algebraic spaces such that the diagram

$$\begin{array}{ccc} U & \xrightarrow{\quad} & V \\ \downarrow & \searrow f & \downarrow \\ X_n & \xrightarrow{f_\varphi} & X_m \end{array}$$

is commutative. Consider the full subcategories

$$X_{\text{affine},\acute{e}tale} \subset X_{\acute{e}tale} \subset X_{\text{spaces},\acute{e}tale}$$

whose objects are U/X_n with U affine, respectively a scheme. Endowing these categories with their natural topologies (see Properties of Spaces, Lemma 18.5, Definition 18.1, and Lemma 18.3) these inclusion functors define equivalences of topoi

$$Sh(X_{\text{affine},\acute{e}tale}) = Sh(X_{\acute{e}tale}) = Sh(X_{\text{spaces},\acute{e}tale})$$

In the following we will silently identify these topoi. We will say that $X_{\acute{e}tale}$ is the *small étale site of X* and its topos is the *small étale topos of X* .

Let $X_{\acute{e}tale}$ be the small étale site of a simplicial algebraic space X . There is a sheaf of rings \mathcal{O} on $X_{\acute{e}tale}$ whose restriction to X_n is the structure sheaf \mathcal{O}_{X_n} . This follows from Lemma 3.4. We will say \mathcal{O} is the *structure sheaf of the simplicial algebraic space X* . At this point all the material developed for simplicial (ringed) sites applies, see Sections 3, 4, 5, 6, 8, 9, 10, 11, 12, 14, and 15.

Let X be a simplicial algebraic space with structure sheaf \mathcal{O} . As on any ringed topos, there is a notion of a *quasi-coherent \mathcal{O} -module on $X_{\acute{e}tale}$* , see Modules on Sites, Definition 23.1. However, a quasi-coherent \mathcal{O} -module on $X_{\acute{e}tale}$ is just a cartesian \mathcal{O} -module \mathcal{F} whose restrictions \mathcal{F}_n are quasi-coherent on X_n , see Lemma 12.10.

Let $h : X \rightarrow Y$ be a morphism of simplicial algebraic spaces over S . By Lemma 5.2 applied to the morphisms of sites $(h_n)_{\text{spaces},\acute{e}tale} : X_{\text{spaces},\acute{e}tale} \rightarrow Y_{\text{spaces},\acute{e}tale}$ (Properties of Spaces, Lemma 18.7) we obtain a morphism of small étale topoi $h_{\acute{e}tale} : Sh(X_{\acute{e}tale}) \rightarrow Sh(Y_{\acute{e}tale})$. Recall that $h_{\acute{e}tale}^{-1}$ and $h_{\acute{e}tale,*}$ have a simple description in terms of the components, see Lemma 5.2. Let \mathcal{O}_X , resp. \mathcal{O}_Y denote the structure sheaf of X , resp. Y . We define $h_{\acute{e}tale}^\sharp : h_{\acute{e}tale,*}\mathcal{O}_X \rightarrow \mathcal{O}_Y$ to be the map of sheaves of rings on $Y_{\acute{e}tale}$ given by $h_n^\sharp : h_{n,*}\mathcal{O}_{X_n} \rightarrow \mathcal{O}_{Y_n}$ on Y_n . We obtain a morphism of ringed topoi

$$h_{\acute{e}tale} : (Sh(X_{\acute{e}tale}), \mathcal{O}_X) \longrightarrow (Sh(Y_{\acute{e}tale}), \mathcal{O}_Y)$$

Let X be a simplicial algebraic space with structure sheaf \mathcal{O} . Let X_{-1} be an algebraic space over S and let $a_0 : X_0 \rightarrow X_{-1}$ be an augmentation of X . By Lemma 4.2 applied to the morphism of sites $(a_0)_{\text{spaces},\acute{e}tale} : X_{0,\text{spaces},\acute{e}tale} \rightarrow X_{-1,\text{spaces},\acute{e}tale}$ we obtain a corresponding morphism of topoi $a : Sh(X_{\acute{e}tale}) \rightarrow Sh(X_{-1,\acute{e}tale})$. Observe that $a^{-1}\mathcal{G}$ is the sheaf on $X_{\acute{e}tale}$ with components $a_n^{-1}\mathcal{G}$. Hence we can use the maps $a_n^\sharp : a_n^{-1}\mathcal{O}_{X_{-1}} \rightarrow \mathcal{O}_{X_n}$ to define a map $a^\sharp : a^{-1}\mathcal{O}_{X_{-1}} \rightarrow \mathcal{O}$, or equivalently by adjunction a map $a^\sharp : \mathcal{O}_{X_{-1}} \rightarrow a_*\mathcal{O}$ (which as usual has the same name). This puts us in the situation discussed in Section 11. Therefore we obtain a morphism of ringed topoi

$$a : (Sh(X_{\acute{e}tale}), \mathcal{O}) \longrightarrow (Sh(X_{-1}), \mathcal{O}_{X_{-1}})$$

A final observation is the following. Suppose we are given a morphism $h : X \rightarrow Y$ of simplicial algebraic spaces X and Y with structure sheaves $\mathcal{O}_X, \mathcal{O}_Y$, augmentations $a_0 : X_0 \rightarrow X_{-1}, b_0 : Y_0 \rightarrow Y_{-1}$ and a morphism $h_{-1} : X_{-1} \rightarrow Y_{-1}$ such that

$$\begin{array}{ccc} X_0 & \xrightarrow{\quad} & Y_0 \\ a_0 \downarrow & & \downarrow b_0 \\ X_{-1} & \xrightarrow{\quad} & Y_{-1} \end{array}$$

commutes. Then from the constructions elucidated above we obtain a commutative diagram of morphisms of ringed topoi as follows

$$\begin{array}{ccc} (Sh(X_{\acute{e}tale}), \mathcal{O}_X) & \xrightarrow{\quad} & (Sh(Y_{\acute{e}tale}), \mathcal{O}_Y) \\ a \downarrow & & \downarrow b \\ (Sh(X_{-1}), \mathcal{O}_{X_{-1}}) & \xrightarrow{\quad} & (Sh(Y_{-1}), \mathcal{O}_{Y_{-1}}) \end{array}$$

34. Fppf hypercoverings of algebraic spaces

0DH4 This section is the analogue of Section 26 for the case of algebraic spaces and fppf hypercoverings. The reader who wishes to do so, can replace “algebraic space” everywhere with “scheme” and get equally valid results. This has the advantage of replacing the references to More on Cohomology of Spaces, Section 6 with references to Étale Cohomology, Section 82.

We fix a base scheme S . Let X be an algebraic space over S and let U be a simplicial algebraic space over S . Assume we have an augmentation

$$a : U \rightarrow X$$

See Section 33. We say that U is an *fppf hypercovering* of X if

- (1) $U_0 \rightarrow X$ is flat, locally of finite presentation, and surjective,
- (2) $U_1 \rightarrow U_0 \times_X U_0$ is flat, locally of finite presentation, and surjective,
- (3) $U_{n+1} \rightarrow (\text{cosk}_n \text{sk}_n U)_{n+1}$ is flat, locally of finite presentation, and surjective for $n \geq 1$.

The category of algebraic spaces over S has all finite limits, hence the coskeleta used in the formulation above exist.

Principle: Fppf hypercoverings can be used to compute étale cohomology.

The key idea behind the proof of the principle is to compare the fppf and étale topologies on the category Spaces/S . Namely, the fppf topology is stronger than the étale topology and we have (a) a flat, locally finitely presented, surjective map defines an fppf covering, and (b) fppf cohomology of sheaves pulled back from the small étale site agrees with étale cohomology as we have seen in More on Cohomology of Spaces, Section 6.

0DH5 **Lemma 34.1.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. There is a*

commutative diagram

$$\begin{array}{ccc} \mathrm{Sh}((\mathrm{Spaces}/U)_{fppf, total}) & \xrightarrow{h} & \mathrm{Sh}(U_{\acute{e}tale}) \\ \downarrow a_{fppf} & & \downarrow a \\ \mathrm{Sh}((\mathrm{Spaces}/X)_{fppf}) & \xrightarrow{h_{-1}} & \mathrm{Sh}(X_{\acute{e}tale}) \end{array}$$

where the left vertical arrow is defined in Section 22 and the right vertical arrow is defined in Section 33.

Proof. The notation $(\mathrm{Spaces}/U)_{fppf, total}$ indicates that we are using the construction of Section 22 for the site $(\mathrm{Spaces}/S)_{fppf}$ and the simplicial object U of this site⁶. We will use the sites $X_{spaces, \acute{e}tale}$ and $U_{spaces, \acute{e}tale}$ for the topoi on the right hand side; this is permissible see discussion in Section 33.

Observe that both $(\mathrm{Spaces}/U)_{fppf, total}$ and $U_{spaces, \acute{e}tale}$ fall into case A of Situation 3.3. This is immediate from the construction of $U_{\acute{e}tale}$ in Section 33 and it follows from Lemma 22.5 for $(\mathrm{Spaces}/U)_{fppf, total}$. Next, consider the functors $U_{n, spaces, \acute{e}tale} \rightarrow (\mathrm{Spaces}/U_n)_{fppf}$, $U \mapsto U/U_n$ and $X_{spaces, \acute{e}tale} \rightarrow (\mathrm{Spaces}/X)_{fppf}$, $U \mapsto U/X$. We have seen that these define morphisms of sites in More on Cohomology of Spaces, Section 6 where these were denoted $a_{U_n} = \epsilon_{U_n} \circ \pi_{u_n}$ and $a_X = \epsilon_X \circ \pi_X$. Thus we obtain a morphism of simplicial sites compatible with augmentations as in Remark 5.4 and we may apply Lemma 5.5 to conclude. \square

0DH6 **Lemma 34.2.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. If $a : U \rightarrow X$ is an fppf hypercovering of X , then*

$$a^{-1} : \mathrm{Sh}(X_{\acute{e}tale}) \rightarrow \mathrm{Sh}(U_{\acute{e}tale}) \quad \text{and} \quad a^{-1} : \mathrm{Ab}(X_{\acute{e}tale}) \rightarrow \mathrm{Ab}(U_{\acute{e}tale})$$

are fully faithful with essential image the cartesian sheaves and quasi-inverse given by a_* . Here $a : \mathrm{Sh}(U_{\acute{e}tale}) \rightarrow \mathrm{Sh}(X_{\acute{e}tale})$ is as in Section 33.

Proof. We will prove the statement for sheaves of sets. It will be an almost formal consequence of results already established. Consider the diagram of Lemma 34.1. In the proof of this lemma we have seen that h_{-1} is the morphism a_X of More on Cohomology of Spaces, Section 6. Thus it follows from More on Cohomology of Spaces, Lemma 6.1 that $(h_{-1})^{-1}$ is fully faithful with quasi-inverse $h_{-1,*}$. The same holds true for the components h_n of h . By the description of the functors h^{-1} and h_* of Lemma 5.2 we conclude that h^{-1} is fully faithful with quasi-inverse h_* . Observe that U is a hypercovering of X in $(\mathrm{Spaces}/S)_{fppf}$ as defined in Section 22. By Lemma 22.1 we see that a_{fppf}^{-1} is fully faithful with quasi-inverse $a_{fppf,*}$ and with essential image the cartesian sheaves on $(\mathrm{Spaces}/U)_{fppf, total}$. A formal argument (chasing around the diagram) now shows that a^{-1} is fully faithful.

Finally, suppose that \mathcal{G} is a cartesian sheaf on $U_{\acute{e}tale}$. Then $h^{-1}\mathcal{G}$ is a cartesian sheaf on $(\mathrm{Spaces}/U)_{fppf, total}$. Hence $h^{-1}\mathcal{G} = a_{fppf}^{-1}\mathcal{H}$ for some sheaf \mathcal{H} on $(\mathrm{Spaces}/X)_{fppf}$. In particular we find that $h_0^{-1}\mathcal{G}_0 = (a_{0, big, fppf})^{-1}\mathcal{H}$. Recalling that $h_0 = a_{U_0}$ and that $U_0 \rightarrow X$ is flat, locally of finite presentation, and surjective, we find from More on Cohomology of Spaces, Lemma 6.7 that there exists a sheaf \mathcal{F} on $X_{\acute{e}tale}$ and isomorphism $\mathcal{H} = (h_{-1})^{-1}\mathcal{F}$. Since $a_{fppf}^{-1}\mathcal{H} = h^{-1}\mathcal{G}$

⁶We could also use the étale topology and this would be denoted $(\mathrm{Spaces}/U)_{\acute{e}tale, total}$.

we deduce that $h^{-1}\mathcal{G} \cong h^{-1}a^{-1}\mathcal{F}$. By fully faithfulness of h^{-1} we conclude that $a^{-1}\mathcal{F} \cong \mathcal{G}$.

Fix an isomorphism $\theta : a^{-1}\mathcal{F} \rightarrow \mathcal{G}$. To finish the proof we have to show $\mathcal{G} = a^{-1}a_*\mathcal{G}$ (in order to show that the quasi-inverse is given by a_* ; everything else has been proven above). Because a^{-1} is fully faithful we have $\text{id} \cong a_*a^{-1}$ by Categories, Lemma 24.3. Thus $\mathcal{F} \cong a_*a^{-1}\mathcal{F}$ and $a_*\theta : a_*a^{-1}\mathcal{F} \rightarrow a_*\mathcal{G}$ combine to an isomorphism $\mathcal{F} \rightarrow a_*\mathcal{G}$. Pulling back by a and precomposing by θ^{-1} we find the desired isomorphism. \square

0DH7 **Lemma 34.3.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. If $a : U \rightarrow X$ is an fppf hypercovering of X , then for $K \in D^+(X_{\acute{e}tale})$*

$$K \rightarrow Ra_*(a^{-1}K)$$

is an isomorphism. Here $a : Sh(U_{\acute{e}tale}) \rightarrow Sh(X_{\acute{e}tale})$ is as in Section 33.

Proof. Consider the diagram of Lemma 34.1. Observe that $Rh_{n,*}h_n^{-1}$ is the identity functor on $D^+(U_{n,\acute{e}tale})$ by More on Cohomology of Spaces, Lemma 6.2. Hence Rh_*h^{-1} is the identity functor on $D^+(U_{\acute{e}tale})$ by Lemma 5.3. We have

$$\begin{aligned} Ra_*(a^{-1}K) &= Ra_*Rh_*h^{-1}a^{-1}K \\ &= Rh_{-1,*}Ra_{fppf,*}a_{fppf}^{-1}(h_{-1})^{-1}K \\ &= Rh_{-1,*}(h_{-1})^{-1}K \\ &= K \end{aligned}$$

The first equality by the discussion above, the second equality because of the commutativity of the diagram in Lemma 26.1, the third equality by Lemma 22.2 as U is a hypercovering of X in $(Spaces/S)_{fppf}$, and the last equality by the already used More on Cohomology of Spaces, Lemma 6.2. \square

0DH8 **Lemma 34.4.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. If $a : U \rightarrow X$ is an fppf hypercovering of X , then*

$$R\Gamma(X_{\acute{e}tale}, K) = R\Gamma(U_{\acute{e}tale}, a^{-1}K)$$

for $K \in D^+(X_{\acute{e}tale})$. Here $a : Sh(U_{\acute{e}tale}) \rightarrow Sh(X_{\acute{e}tale})$ is as in Section 33.

Proof. This follows from Lemma 34.3 because $R\Gamma(U_{\acute{e}tale}, -) = R\Gamma(X_{\acute{e}tale}, -) \circ Ra_*$ by Cohomology on Sites, Remark 15.4. \square

0DH9 **Lemma 34.5.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. Let $\mathcal{A} \subset Ab(U_{\acute{e}tale})$ denote the weak Serre subcategory of cartesian abelian sheaves. If U is an fppf hypercovering of X , then the functor a^{-1} defines an equivalence*

$$D^+(X_{\acute{e}tale}) \longrightarrow D_{\mathcal{A}}^+(U_{\acute{e}tale})$$

with quasi-inverse Ra_ . Here $a : Sh(U_{\acute{e}tale}) \rightarrow Sh(X_{\acute{e}tale})$ is as in Section 33.*

Proof. Observe that \mathcal{A} is a weak Serre subcategory by Lemma 12.6. The equivalence is a formal consequence of the results obtained so far. Use Lemmas 13.5, 34.2, and 34.3. \square

0DHA **Lemma 34.6.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. Let \mathcal{F} be an abelian sheaf on $X_{\acute{e}tale}$. Let \mathcal{F}_n be the pullback to $U_n, \acute{e}tale$. If U is an fppf hypercovering of X , then there exists a canonical spectral sequence*

$$E_1^{p,q} = H_{\acute{e}tale}^q(U_p, \mathcal{F}_p)$$

converging to $H_{\acute{e}tale}^{p+q}(X, \mathcal{F})$.

Proof. Immediate consequence of Lemmas 34.4 and 8.3. \square

35. Fppf hypercoverings of algebraic spaces: modules

0DHB We continue the discussion of (cohomological) descent for fppf hypercoverings started in Section 34 but in this section we discuss what happens for sheaves of modules. We mainly discuss quasi-coherent modules and it turns out that we can do unbounded cohomological descent for those.

0DHC **Lemma 35.1.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. There is a commutative diagram*

$$\begin{array}{ccc} (Sh((Spaces/U)_{fppf, total}), \mathcal{O}_{big, total}) & \xrightarrow{h} & (Sh(U_{\acute{e}tale}), \mathcal{O}_U) \\ \downarrow a_{fppf} & & \downarrow a \\ (Sh((Spaces/X)_{fppf}), \mathcal{O}_{big}) & \xrightarrow{h_{-1}} & (Sh(X_{\acute{e}tale}), \mathcal{O}_X) \end{array}$$

of ringed topoi where the left vertical arrow is defined in Section 23 and the right vertical arrow is defined in Section 33.

Proof. For the underlying diagram of topoi we refer to the discussion in the proof of Lemma 34.1. The sheaf \mathcal{O}_U is the structure sheaf of the simplicial algebraic space U as defined in Section 33. The sheaf \mathcal{O}_X is the usual structure sheaf of the algebraic space X . The sheaves of rings $\mathcal{O}_{big, total}$ and \mathcal{O}_{big} come from the structure sheaf on $(Spaces/S)_{fppf}$ in the manner explained in Section 23 which also constructs a_{fppf} as a morphism of ringed topoi. The component morphisms $h_n = a_{U_n}$ and $h_{-1} = a_X$ are morphisms of ringed topoi by More on Cohomology of Spaces, Section 7. Finally, since the continuous functor $u : U_{spaces, \acute{e}tale} \rightarrow (Spaces/U)_{fppf, total}$ used to define h^7 is given by $V/U_n \mapsto V/U_n$ we see that $h_* \mathcal{O}_{big, total} = \mathcal{O}_U$ which is how we endow h with the structure of a morphism of ringed simplicial sites as in Remark 7.1. Then we obtain h as a morphism of ringed topoi by Lemma 7.2. Please observe that the morphisms h_n indeed agree with the morphisms a_{U_n} described above. We omit the verification that the diagram is commutative (as a diagram of ringed topoi – we already know it is commutative as a diagram of topoi). \square

0DHD **Lemma 35.2.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. If $a : U \rightarrow X$ is an fppf hypercovering of X , then*

$$a^* : QCoh(\mathcal{O}_X) \rightarrow QCoh(\mathcal{O}_U)$$

is an equivalence fully faithful with quasi-inverse given by a_ . Here $a : Sh(U_{\acute{e}tale}) \rightarrow Sh(X_{\acute{e}tale})$ is as in Section 33.*

⁷This happened in the proof of Lemma 34.1 via an application of Lemma 5.5.

Proof. Consider the diagram of Lemma 35.1. In the proof of this lemma we have seen that h_{-1} is the morphism a_X of More on Cohomology of Spaces, Section 7. Thus it follows from More on Cohomology of Spaces, Lemma 7.1 that

$$(h_{-1})^* : QCoh(\mathcal{O}_X) \longrightarrow QCoh(\mathcal{O}_{big})$$

is an equivalence with quasi-inverse $h_{-1,*}$. The same holds true for the components h_n of h . Recall that $QCoh(\mathcal{O}_U)$ and $QCoh(\mathcal{O}_{big,total})$ consist of cartesian modules whose components are quasi-coherent, see Lemma 12.10. Since the functors h^* and h_* of Lemma 7.2 agree with the functors h_n^* and $h_{n,*}$ on components we conclude that

$$h^* : QCoh(\mathcal{O}_U) \longrightarrow QCoh(\mathcal{O}_{big,total})$$

is an equivalence with quasi-inverse h_* . Observe that U is a hypercovering of X in $(Spaces/S)_{fppf}$ as defined in Section 22. By Lemma 23.1 we see that a_{fppf}^* is fully faithful with quasi-inverse $a_{fppf,*}$ and with essential image the cartesian sheaves of $\mathcal{O}_{fppf,total}$ -modules. Thus, by the description of $QCoh(\mathcal{O}_{big})$ and $QCoh(\mathcal{O}_{big,total})$ of Lemma 12.10, we get an equivalence

$$a_{fppf}^* : QCoh(\mathcal{O}_{big}) \longrightarrow QCoh(\mathcal{O}_{big,total})$$

with quasi-inverse given by $a_{fppf,*}$. A formal argument (chasing around the diagram) now shows that a^* is fully faithful on $QCoh(\mathcal{O}_X)$ and has image contained in $QCoh(\mathcal{O}_U)$.

Finally, suppose that \mathcal{G} is in $QCoh(\mathcal{O}_U)$. Then $h^*\mathcal{G}$ is in $QCoh(\mathcal{O}_{big,total})$. Hence $h^*\mathcal{G} = a_{fppf}^*\mathcal{H}$ with $\mathcal{H} = a_{fppf,*}h^*\mathcal{G}$ in $QCoh(\mathcal{O}_{big})$ (see above). In turn we see that $\mathcal{H} = (h_{-1})^*\mathcal{F}$ with $\mathcal{F} = h_{-1,*}\mathcal{H}$ in $QCoh(\mathcal{O}_X)$. Going around the diagram we deduce that $h^*\mathcal{G} \cong h^*a^*\mathcal{F}$. By fully faithfulness of h^* we conclude that $a^*\mathcal{F} \cong \mathcal{G}$. Since $\mathcal{F} = h_{-1,*}a_{fppf,*}h^*\mathcal{G} = a_*h_*h^*\mathcal{G} = a_*\mathcal{G}$ we also obtain the statement that the quasi-inverse is given by a_* . \square

ODHE **Lemma 35.3.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. If $a : U \rightarrow X$ is an fppf hypercovering of X , then for \mathcal{F} a quasi-coherent \mathcal{O}_X -module the map*

$$\mathcal{F} \rightarrow Ra_*(a^*\mathcal{F})$$

is an isomorphism. Here $a : Sh(U_{\acute{e}tale}) \rightarrow Sh(X_{\acute{e}tale})$ is as in Section 33.

Proof. Consider the diagram of Lemma 34.1. Let $\mathcal{F}_n = a_n^*\mathcal{F}$ be the n th component of $a^*\mathcal{F}$. This is a quasi-coherent \mathcal{O}_{U_n} -module. Then $\mathcal{F}_n = Rh_{n,*}h_n^*\mathcal{F}_n$ by More on Cohomology of Spaces, Lemma 7.2. Hence $a^*\mathcal{F} = Rh_*h^*a^*\mathcal{F}$ by Lemma 7.3. We have

$$\begin{aligned} Ra_*(a^*\mathcal{F}) &= Ra_*Rh_*h^*a^*\mathcal{F} \\ &= Rh_{-1,*}Ra_{fppf,*}a_{fppf}^*(h_{-1})^*\mathcal{F} \\ &= Rh_{-1,*}(h_{-1})^*\mathcal{F} \\ &= \mathcal{F} \end{aligned}$$

The first equality by the discussion above, the second equality because of the commutativity of the diagram in Lemma 26.1, the third equality by Lemma 23.2 as U is a hypercovering of X in $(Spaces/S)_{fppf}$ and $La_{fppf}^* = a_{fppf}^*$ as a_{fppf} is flat (namely $a_{fppf}^{-1}\mathcal{O}_{big} = \mathcal{O}_{big,total}$, see Remark 17.5), and the last equality by the already used More on Cohomology of Spaces, Lemma 7.2. \square

0DHF **Lemma 35.4.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. Assume $a : U \rightarrow X$ is an fppf hypercovering of X . Then $QCoh(\mathcal{O}_U)$ is a weak Serre subcategory of $Mod(\mathcal{O}_U)$ and*

$$a^* : D_{QCoh}(\mathcal{O}_X) \longrightarrow D_{QCoh}(\mathcal{O}_U)$$

is an equivalence of categories with quasi-inverse given by Ra_ . Here $a : Sh(U_{\acute{e}tale}) \rightarrow Sh(X_{\acute{e}tale})$ is as in Section 33.*

Proof. First observe that the maps $a_n : U_n \rightarrow X$ and $d_i^n : U_n \rightarrow U_{n-1}$ are flat, locally of finite presentation, and surjective by Hypercoverings, Remark 8.4.

Recall that an \mathcal{O}_U -module \mathcal{F} is quasi-coherent if and only if it is cartesian and \mathcal{F}_n is quasi-coherent for all n . See Lemma 12.10. By Lemma 12.6 (and flatness of the maps $d_i^n : U_n \rightarrow U_{n-1}$ shown above) the cartesian modules for a weak Serre subcategory of $Mod(\mathcal{O}_U)$. On the other hand $QCoh(\mathcal{O}_{U_n}) \subset Mod(\mathcal{O}_{U_n})$ is a weak Serre subcategory for each n (Properties of Spaces, Lemma 29.7). Combined we see that $QCoh(\mathcal{O}_U) \subset Mod(\mathcal{O}_U)$ is a weak Serre subcategory.

To finish the proof we check the conditions (1) – (5) of Lemma 13.6 one by one.

Ad (1). This holds since a_n flat (seen above) implies a is flat by Lemma 11.1.

Ad (2). This is the content of Lemma 35.2.

Ad (3). This is the content of Lemma 35.3.

Ad (4). Recall that we can use either the site $U_{\acute{e}tale}$ or $U_{spaces,\acute{e}tale}$ to define the small étale topos $Sh(U_{\acute{e}tale})$, see Section 33. The assumption of Cohomology on Sites, Situation 24.1 holds for the triple $(U_{spaces,\acute{e}tale}, \mathcal{O}_U, QCoh(\mathcal{O}_U))$ and by the same reasoning for the triple $(U_{\acute{e}tale}, \mathcal{O}_U, QCoh(\mathcal{O}_U))$. Namely, take

$$\mathcal{B} \subset \text{Ob}(U_{\acute{e}tale}) \subset \text{Ob}(U_{spaces,\acute{e}tale})$$

to be the set of affine objects. For $V/U_n \in \mathcal{B}$ take $d_{V/U_n} = 0$ and take Cov_{V/U_n} to be the set of étale coverings $\{V_i \rightarrow V\}$ with V_i affine. Then we get the desired vanishing because for $\mathcal{F} \in QCoh(\mathcal{O}_U)$ and any $V/U_n \in \mathcal{B}$ we have

$$H^p(V/U_n, \mathcal{F}) = H^p(V, \mathcal{F}_n)$$

by Lemma 10.4. Here on the right hand side we have the cohomology of the quasi-coherent sheaf \mathcal{F}_n on U_n over the affine object V of $U_{n,\acute{e}tale}$. This vanishes for $p > 0$ by the discussion in Cohomology of Spaces, Section 3 and Cohomology of Schemes, Lemma 2.2.

Ad (5). Follows by taking $\mathcal{B} \subset \text{Ob}(X_{spaces,\acute{e}tale})$ the set of affine objects and the references given above. \square

0DHG **Lemma 35.5.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. If $a : U \rightarrow X$ is an fppf hypercovering of X , then*

$$R\Gamma(X_{\acute{e}tale}, K) = R\Gamma(U_{\acute{e}tale}, a^*K)$$

for $K \in D_{QCoh}(\mathcal{O}_X)$. Here $a : Sh(U_{\acute{e}tale}) \rightarrow Sh(X_{\acute{e}tale})$ is as in Section 33.

Proof. This follows from Lemma 35.4 because $R\Gamma(U_{\acute{e}tale}, -) = R\Gamma(X_{\acute{e}tale}, -) \circ Ra_*$ by Cohomology on Sites, Remark 15.4. \square

0DHH **Lemma 35.6.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. Let \mathcal{F} be quasi-coherent \mathcal{O}_X -module. Let \mathcal{F}_n be the pullback to $U_{n,\acute{e}tale}$. If U is an fppf hypercovering of X , then there exists a canonical spectral sequence*

$$E_1^{p,q} = H_{\acute{e}tale}^q(U_p, \mathcal{F}_p)$$

converging to $H_{\acute{e}tale}^{p+q}(X, \mathcal{F})$.

Proof. Immediate consequence of Lemmas 35.5 and 10.3. \square

36. Fppf descent of complexes

0DL8 In this section we pull some of the previously shown results together for fppf coverings of algebraic spaces and derived categories of quasi-coherent modules.

0DL9 **Lemma 36.1.** *Let X be an algebraic space over a scheme S . Let $K, E \in D_{QCoh}(\mathcal{O}_X)$. Let $a : U \rightarrow X$ be an fppf hypercovering. Assume that for all $n \geq 0$ we have*

$$\mathrm{Ext}_{\mathcal{O}_{U_n}}^i(La_n^*K, La_n^*E) = 0 \text{ for } i < 0$$

Then we have

- (1) $\mathrm{Ext}_{\mathcal{O}_X}^i(K, E) = 0$ for $i < 0$, and
- (2) there is an exact sequence

$$0 \rightarrow \mathrm{Hom}_{\mathcal{O}_X}(K, E) \rightarrow \mathrm{Hom}_{\mathcal{O}_{U_0}}(La_0^*K, La_0^*E) \rightarrow \mathrm{Hom}_{\mathcal{O}_{U_1}}(La_1^*K, La_1^*E)$$

Proof. Write $K_n = La_n^*K$ and $E_n = La_n^*E$. Then these are the simplicial systems of the derived category of modules (Definition 15.1) associated to La^*K and La^*E (Lemma 15.2) where $a : U_{\acute{e}tale} \rightarrow X_{\acute{e}tale}$ is as in Section 33. Let us prove (2) first. By Lemma 35.4 we have

$$\mathrm{Hom}_{\mathcal{O}_X}(K, E) = \mathrm{Hom}_{\mathcal{O}_U}(La^*K, La^*E)$$

Thus the sequence looks like this:

$$0 \rightarrow \mathrm{Hom}_{\mathcal{O}_U}(La^*K, La^*E) \rightarrow \mathrm{Hom}_{\mathcal{O}_{U_0}}(K_0, E_0) \rightarrow \mathrm{Hom}_{\mathcal{O}_{U_1}}(K_1, E_1)$$

The first arrow is injective by Lemma 15.4. The image of this arrow is the kernel of the second by Lemma 15.5. This finishes the proof of (2). Part (1) follows by applying part (2) with $K[i]$ and E for $i > 0$. \square

0DLA **Lemma 36.2.** *Let X be an algebraic space over a scheme S . Let $a : U \rightarrow X$ be an fppf hypercovering. Suppose given $K_0 \in D_{QCoh}(U_0)$ and an isomorphism*

$$\alpha : L(f_{\delta_1^1})^*K_0 \longrightarrow L(f_{\delta_0^1})^*K_0$$

satisfying the cocycle condition on U_1 . Set $\tau_i^n : [0] \rightarrow [n]$, $0 \mapsto i$ and set $K_n = Lf_{\tau_n^*}^*K_0$. Assume $\mathrm{Ext}_{\mathcal{O}_{U_n}}^i(K_n, K_n) = 0$ for $i < 0$. Then there exists an object $K \in D_{QCoh}(\mathcal{O}_X)$ and an isomorphism $La_0^*K \rightarrow K$ compatible with α .

Proof. We claim that the objects K_n form the members of a simplicial system of the derived category of modules (Definition 15.1) of the ringed simplicial site $U_{\acute{e}tale}$ of Section 33. The construction is analogous to the construction discussed in Descent, Section 3 from which we borrow the notation $\tau_i^n : [0] \rightarrow [n]$, $0 \mapsto i$ and

$\tau_{ij}^n : [1] \rightarrow [n]$, $0 \mapsto i$, $1 \mapsto j$. Given $\varphi : [n] \rightarrow [m]$ we define $K_\varphi : L(f_\varphi)^* K_n \rightarrow K_m$ using

$$\begin{array}{ccccccc} L(f_\varphi)^* K_n & \xlongequal{\quad} & L(f_\varphi)^* L(f_{\tau_n^m})^* K_0 & \xlongequal{\quad} & L(f_{\tau_{\varphi(n)}^m})^* K_0 & \xlongequal{\quad} & L(f_{\tau_{\varphi(n)}^m})^* L(f_{\delta_1^1})^* K_0 \\ & & & & & & \downarrow L(f_{\tau_{\varphi(n)}^m})^* \alpha \\ & & & & K_m & \xlongequal{\quad} & L(f_{\tau_m^m})^* K_0 \xlongequal{\quad} L(f_{\tau_{\varphi(n)}^m})^* L(f_{\delta_0^1})^* K_0 \end{array}$$

We omit the verification that the cocycle condition implies the maps compose correctly (in their respective derived categories) and hence give rise to a simplicial systems of the derived category of modules⁸. Once this is verified, we obtain an object $K' \in D_{QCoh}(\mathcal{O}_{U_{\acute{e}tale}})$ such that (K_n, K_φ) is the system deduced from K' , see Lemma 15.6. Finally, we apply Lemma 35.4 to see that $K' = La^*K$ for some $K \in D_{QCoh}(\mathcal{O}_X)$ as desired. \square

37. Proper hypercoverings of algebraic spaces

ODHI This section is the analogue of Section 26 for the case of algebraic spaces. The reader who wishes to do so, can replace “algebraic space” everywhere with “scheme” and get equally valid results. This has the advantage of replacing the references to More on Cohomology of Spaces, Section 8 with references to Étale Cohomology, Section 84.

We fix a base scheme S . Let X be an algebraic space over S and let U be a simplicial algebraic space over S . Assume we have an augmentation

$$a : U \rightarrow X$$

See Section 33. We say that U is a *proper hypercovering* of X if

- (1) $U_0 \rightarrow X$ is proper and surjective,
- (2) $U_1 \rightarrow U_0 \times_X U_0$ is proper and surjective,
- (3) $U_{n+1} \rightarrow (\text{cosk}_n \text{sk}_n U)_{n+1}$ is proper and surjective for $n \geq 1$.

The category of algebraic spaces over S has all finite limits, hence the coskeleta used in the formulation above exist.

Principle: Proper hypercoverings can be used to compute étale cohomology.

The key idea behind the proof of the principle is to compare the ph and étale topologies on the category Spaces/S . Namely, the ph topology is stronger than the étale topology and we have (a) a proper surjective map defines a ph covering, and (b) ph cohomology of sheaves pulled back from the small étale site agrees with étale cohomology as we have seen in More on Cohomology of Spaces, Section 8.

All results in this section generalize to the case where $U \rightarrow X$ is merely a “ph hypercovering”, meaning a hypercovering of X in the site $(\text{Spaces}/S)_{ph}$ as defined in Section 22. If we ever need this, we will precisely formulate and prove this here.

⁸This verification is the same as that done in the proof of Lemma 12.4 as well as in the chapter on descent referenced above. We should probably write this as a general lemma about fibred and cofibred categories over Δ .

0DHJ **Lemma 37.1.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. There is a commutative diagram*

$$\begin{array}{ccc} \mathrm{Sh}((\mathrm{Spaces}/U)_{ph,total}) & \xrightarrow{h} & \mathrm{Sh}(U_{\acute{e}tale}) \\ a_{ph} \downarrow & & \downarrow a \\ \mathrm{Sh}((\mathrm{Spaces}/X)_{ph}) & \xrightarrow{h_{-1}} & \mathrm{Sh}(X_{\acute{e}tale}) \end{array}$$

where the left vertical arrow is defined in Section 22 and the right vertical arrow is defined in Section 33.

Proof. The notation $(\mathrm{Spaces}/U)_{ph,total}$ indicates that we are using the construction of Section 22 for the site $(\mathrm{Spaces}/S)_{ph}$ and the simplicial object U of this site⁹. We will use the sites $X_{spaces,\acute{e}tale}$ and $U_{spaces,\acute{e}tale}$ for the topoi on the right hand side; this is permissible see discussion in Section 33.

Observe that both $(\mathrm{Spaces}/U)_{ph,total}$ and $U_{spaces,\acute{e}tale}$ fall into case A of Situation 3.3. This is immediate from the construction of $U_{\acute{e}tale}$ in Section 33 and it follows from Lemma 22.5 for $(\mathrm{Spaces}/U)_{ph,total}$. Next, consider the functors $U_{n,spaces,\acute{e}tale} \rightarrow (\mathrm{Spaces}/U_n)_{ph}$, $U \mapsto U/U_n$ and $X_{spaces,\acute{e}tale} \rightarrow (\mathrm{Spaces}/X)_{ph}$, $U \mapsto U/X$. We have seen that these define morphisms of sites in More on Cohomology of Spaces, Section 8 where these were denoted $a_{U_n} = \epsilon_{U_n} \circ \pi_{u_n}$ and $a_X = \epsilon_X \circ \pi_X$. Thus we obtain a morphism of simplicial sites compatible with augmentations as in Remark 5.4 and we may apply Lemma 5.5 to conclude. \square

0DHK **Lemma 37.2.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. If $a : U \rightarrow X$ is a proper hypercovering of X , then*

$$a^{-1} : \mathrm{Sh}(X_{\acute{e}tale}) \rightarrow \mathrm{Sh}(U_{\acute{e}tale}) \quad \text{and} \quad a^{-1} : \mathrm{Ab}(X_{\acute{e}tale}) \rightarrow \mathrm{Ab}(U_{\acute{e}tale})$$

are fully faithful with essential image the cartesian sheaves and quasi-inverse given by a_* . Here $a : \mathrm{Sh}(U_{\acute{e}tale}) \rightarrow \mathrm{Sh}(X_{\acute{e}tale})$ is as in Section 33.

Proof. We will prove the statement for sheaves of sets. It will be an almost formal consequence of results already established. Consider the diagram of Lemma 37.1. In the proof of this lemma we have seen that h_{-1} is the morphism a_X of More on Cohomology of Spaces, Section 8. Thus it follows from More on Cohomology of Spaces, Lemma 8.1 that $(h_{-1})^{-1}$ is fully faithful with quasi-inverse $h_{-1,*}$. The same holds true for the components h_n of h . By the description of the functors h^{-1} and h_* of Lemma 5.2 we conclude that h^{-1} is fully faithful with quasi-inverse h_* . Observe that U is a hypercovering of X in $(\mathrm{Spaces}/S)_{ph}$ as defined in Section 22 since a surjective proper morphism gives a ph covering by Topologies on Spaces, Lemma 8.3. By Lemma 22.1 we see that a_{ph}^{-1} is fully faithful with quasi-inverse $a_{ph,*}$ and with essential image the cartesian sheaves on $(\mathrm{Spaces}/U)_{ph,total}$. A formal argument (chasing around the diagram) now shows that a^{-1} is fully faithful.

Finally, suppose that \mathcal{G} is a cartesian sheaf on $U_{\acute{e}tale}$. Then $h^{-1}\mathcal{G}$ is a cartesian sheaf on $(\mathrm{Spaces}/U)_{ph,total}$. Hence $h^{-1}\mathcal{G} = a_{ph}^{-1}\mathcal{H}$ for some sheaf \mathcal{H} on $(\mathrm{Spaces}/X)_{ph}$. We

⁹To distinguish from $(\mathrm{Spaces}/U)_{fppf,total}$ defined using the fppf topology in Section 34.

compute using somewhat pedantic notation

$$\begin{aligned}
(h_{-1})^{-1}(a_*\mathcal{G}) &= (h_{-1})^{-1}\mathrm{Eq}(a_{0,small,*}\mathcal{G}_0 \rightrightarrows a_{1,small,*}\mathcal{G}_1) \\
&= \mathrm{Eq}((h_{-1})^{-1}a_{0,small,*}\mathcal{G}_0 \rightrightarrows (h_{-1})^{-1}a_{1,small,*}\mathcal{G}_1) \\
&= \mathrm{Eq}(a_{0,big,ph,*}h_0^{-1}\mathcal{G}_0 \rightrightarrows a_{1,big,ph,*}h_1^{-1}\mathcal{G}_1) \\
&= \mathrm{Eq}(a_{0,big,ph,*}(a_{0,big,ph})^{-1}\mathcal{H} \rightrightarrows a_{1,big,ph,*}(a_{1,big,ph})^{-1}\mathcal{H}) \\
&= a_{ph,*}a_{ph}^{-1}\mathcal{H} \\
&= \mathcal{H}
\end{aligned}$$

Here the first equality follows from Lemma 4.2, the second equality follows as $(h_{-1})^{-1}$ is an exact functor, the third equality follows from More on Cohomology of Spaces, Lemma 8.5 (here we use that $a_0 : U_0 \rightarrow X$ and $a_1 : U_1 \rightarrow X$ are proper), the fourth follows from $a_{ph}^{-1}\mathcal{H} = h^{-1}\mathcal{G}$, the fifth from Lemma 4.2, and the sixth we've seen above. Since $a_{ph}^{-1}\mathcal{H} = h^{-1}\mathcal{G}$ we deduce that $h^{-1}\mathcal{G} \cong h^{-1}a^{-1}a_*\mathcal{G}$ which ends the proof by fully faithfulness of h^{-1} . \square

0DHL **Lemma 37.3.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. If $a : U \rightarrow X$ is a proper hypercovering of X , then for $K \in D^+(X_{\acute{e}tale})$*

$$K \rightarrow Ra_*(a^{-1}K)$$

is an isomorphism. Here $a : Sh(U_{\acute{e}tale}) \rightarrow Sh(X_{\acute{e}tale})$ is as in Section 33.

Proof. Consider the diagram of Lemma 37.1. Observe that $Rh_{n,*}h_n^{-1}$ is the identity functor on $D^+(U_{n,\acute{e}tale})$ by More on Cohomology of Spaces, Lemma 8.2. Hence Rh_*h^{-1} is the identity functor on $D^+(U_{\acute{e}tale})$ by Lemma 5.3. We have

$$\begin{aligned}
Ra_*(a^{-1}K) &= Ra_*Rh_*h^{-1}a^{-1}K \\
&= Rh_{-1,*}Ra_{ph,*}a_{ph}^{-1}(h_{-1})^{-1}K \\
&= Rh_{-1,*}(h_{-1})^{-1}K \\
&= K
\end{aligned}$$

The first equality by the discussion above, the second equality because of the commutativity of the diagram in Lemma 26.1, the third equality by Lemma 22.2 as U is a hypercovering of X in $(Spaces/S)_{ph}$ by Topologies on Spaces, Lemma 8.3, and the last equality by the already used More on Cohomology of Spaces, Lemma 8.2. \square

0DHM **Lemma 37.4.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. If $a : U \rightarrow X$ is a proper hypercovering of X , then*

$$R\Gamma(X_{\acute{e}tale}, K) = R\Gamma(U_{\acute{e}tale}, a^{-1}K)$$

for $K \in D^+(X_{\acute{e}tale})$. Here $a : Sh(U_{\acute{e}tale}) \rightarrow Sh(X_{\acute{e}tale})$ is as in Section 33.

Proof. This follows from Lemma 37.3 because $R\Gamma(U_{\acute{e}tale}, -) = R\Gamma(X_{\acute{e}tale}, -) \circ Ra_*$ by Cohomology on Sites, Remark 15.4. \square

0DHN **Lemma 37.5.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. Let $\mathcal{A} \subset \text{Ab}(U_{\text{étale}})$ denote the weak Serre subcategory of cartesian abelian sheaves. If U is a proper hypercovering of X , then the functor a^{-1} defines an equivalence*

$$D^+(X_{\text{étale}}) \longrightarrow D_{\mathcal{A}}^+(U_{\text{étale}})$$

with quasi-inverse Ra_* . Here $a : \text{Sh}(U_{\text{étale}}) \rightarrow \text{Sh}(X_{\text{étale}})$ is as in Section 33.

Proof. Observe that \mathcal{A} is a weak Serre subcategory by Lemma 12.6. The equivalence is a formal consequence of the results obtained so far. Use Lemmas 13.5, 37.2, and 37.3. \square

0DHP **Lemma 37.6.** *Let S be a scheme. Let X be an algebraic space over S . Let U be a simplicial algebraic space over S . Let $a : U \rightarrow X$ be an augmentation. Let \mathcal{F} be an abelian sheaf on $X_{\text{étale}}$. Let \mathcal{F}_n be the pullback to $U_{n,\text{étale}}$. If U is a proper hypercovering of X , then there exists a canonical spectral sequence*

$$E_1^{p,q} = H_{\text{étale}}^q(U_p, \mathcal{F}_p)$$

converging to $H_{\text{étale}}^{p+q}(X, \mathcal{F})$.

Proof. Immediate consequence of Lemmas 37.4 and 8.3. \square
